

# CELIAC DISEASE

Jolanta Jedrzkiewicz, MD, 10.15.12

# University of Utah CME Statement

2

- The University of Utah School of Medicine adheres to ACCME Standards regarding industry support of continuing medical education.
- Speakers are also expected to openly disclose intent to discuss any off-label, experimental, or investigational use of drugs, devices, or equipment in their presentations.
- This speaker has nothing to disclose.

# 9 month old boy with failure to thrive

3

- On questioning:
  - ▣ 3 months ago, solid foods were introduced to his diet including **cereal**
- Physical exam:
  - ▣ Dehydrated, irritable, has a distended abdomen and has not gain weight since the last visit (a month ago)
- **Family history:**
  - ▣ Both parents have celiac disease

**Diagnosis: CELIAC DISEASE**

**Treatment: Gluten free diet**

# Celiac disease (CD)

4

- **Definition:**

- Inflammatory disease of the gut that occurs in predisposed individuals after gluten (wheat) ingestion.

# CME objectives

5

- List the symptoms of celiac disease
- Identify the agent that causes celiac disease
- List criteria for diagnosis
- Compare and contrast different tests that are used
- Justify utilization of serology (antibody test)
- List the antibodies that we test for
- Justify utilization of HLA testing
- List the HLA tests that are used in assessing the risk
- Describe current guidelines and recommendations

# Topics

6

- Definitions and historical background
- Clinical symptoms
- Histologic changes in celiac disease
- Pathophysiology
- Serologic tests
- HLA testing
- Screening
- Treatment
- Monitoring adherence to treatment
- Cases

# Why celiac disease?

7

- 1% in the U.S.
  - 5% prevalence in type 1 DM patients
  - 10% higher prevalence in first degree relatives
    - 70% concordance in identical twins
  - Population affected:
    - Age: infancy, 20-30s, 50-60s
    - Historically, Caucasians of North European ancestry
- Consequences for untreated patients
  - Malabsorption
  - Cancer

# Historical background

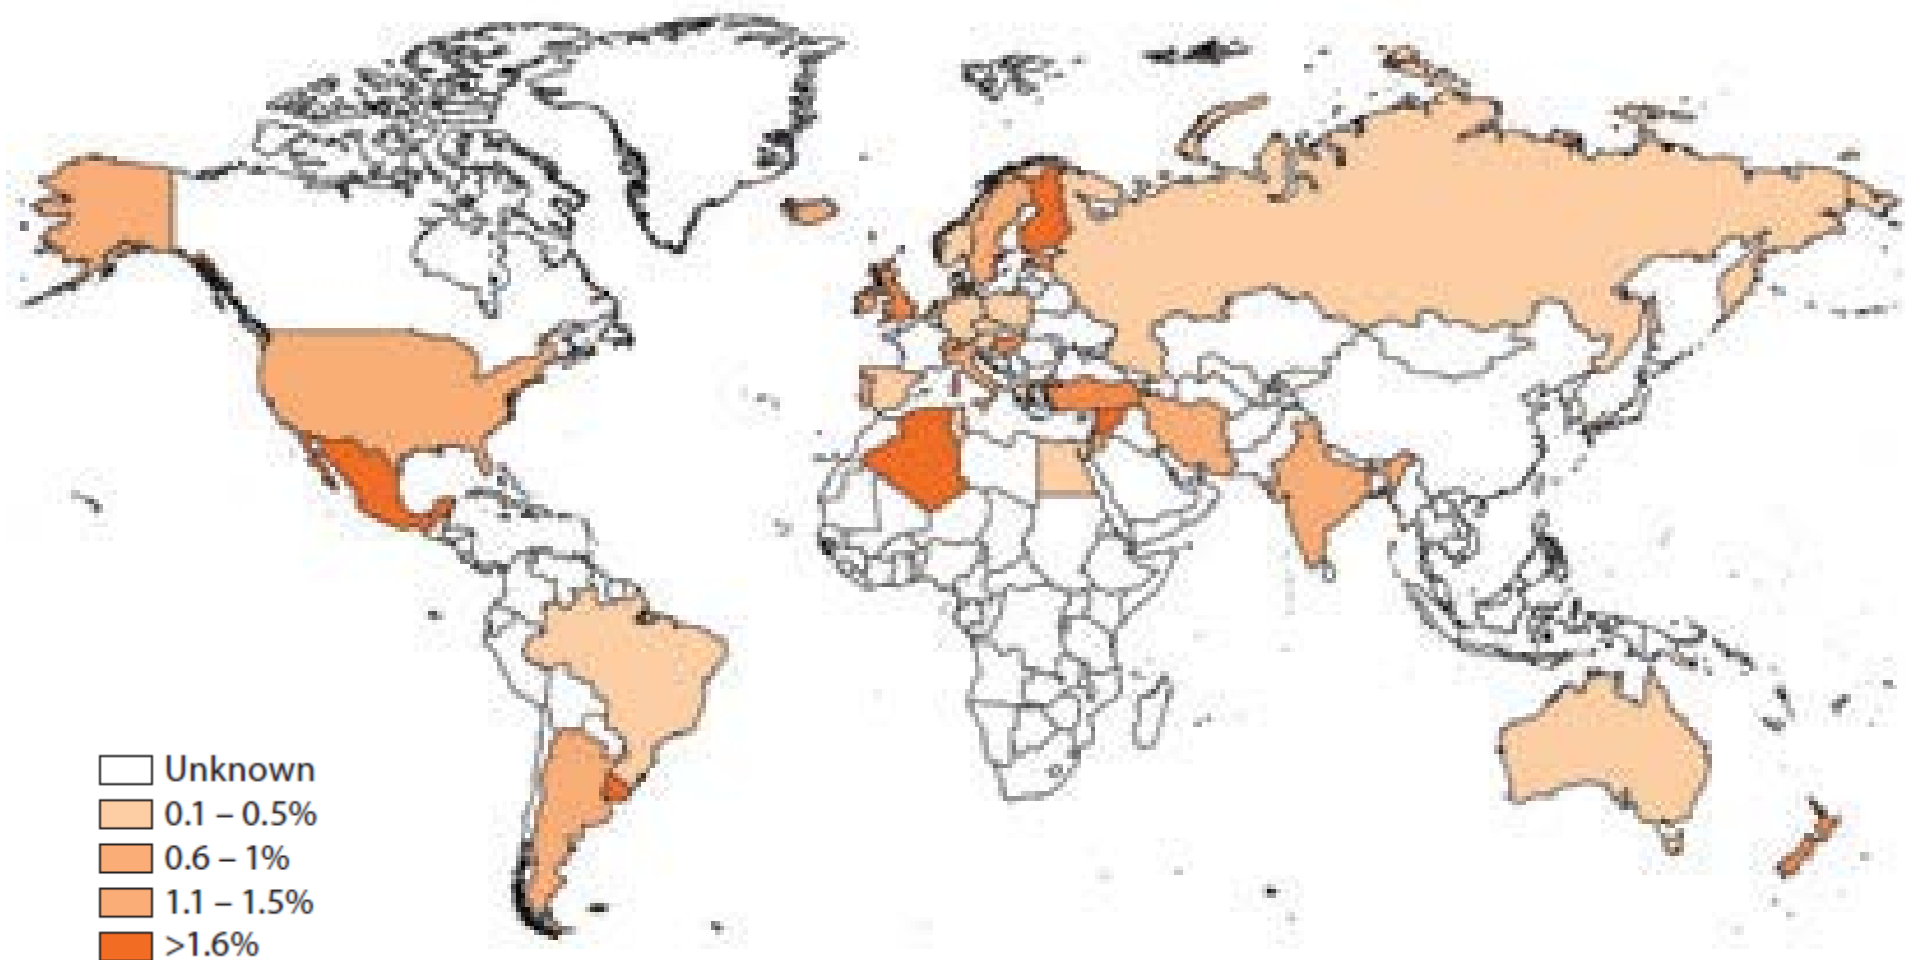

8

- 100-200 AD: Aretaeus (Greek physician)
  - ▣ Description of disease
- 1888: Gee
  - ▣ Dietary causation
- 1950s: Dicke and colleagues
  - ▣ Wheat and rye brought on celiac disease
- 1954: Paulley
  - ▣ Clinical manifestation are linked to small intestine damage
- 1990s: genetic association with HLA
- 1992: Marsh
  - ▣ Histologic classification

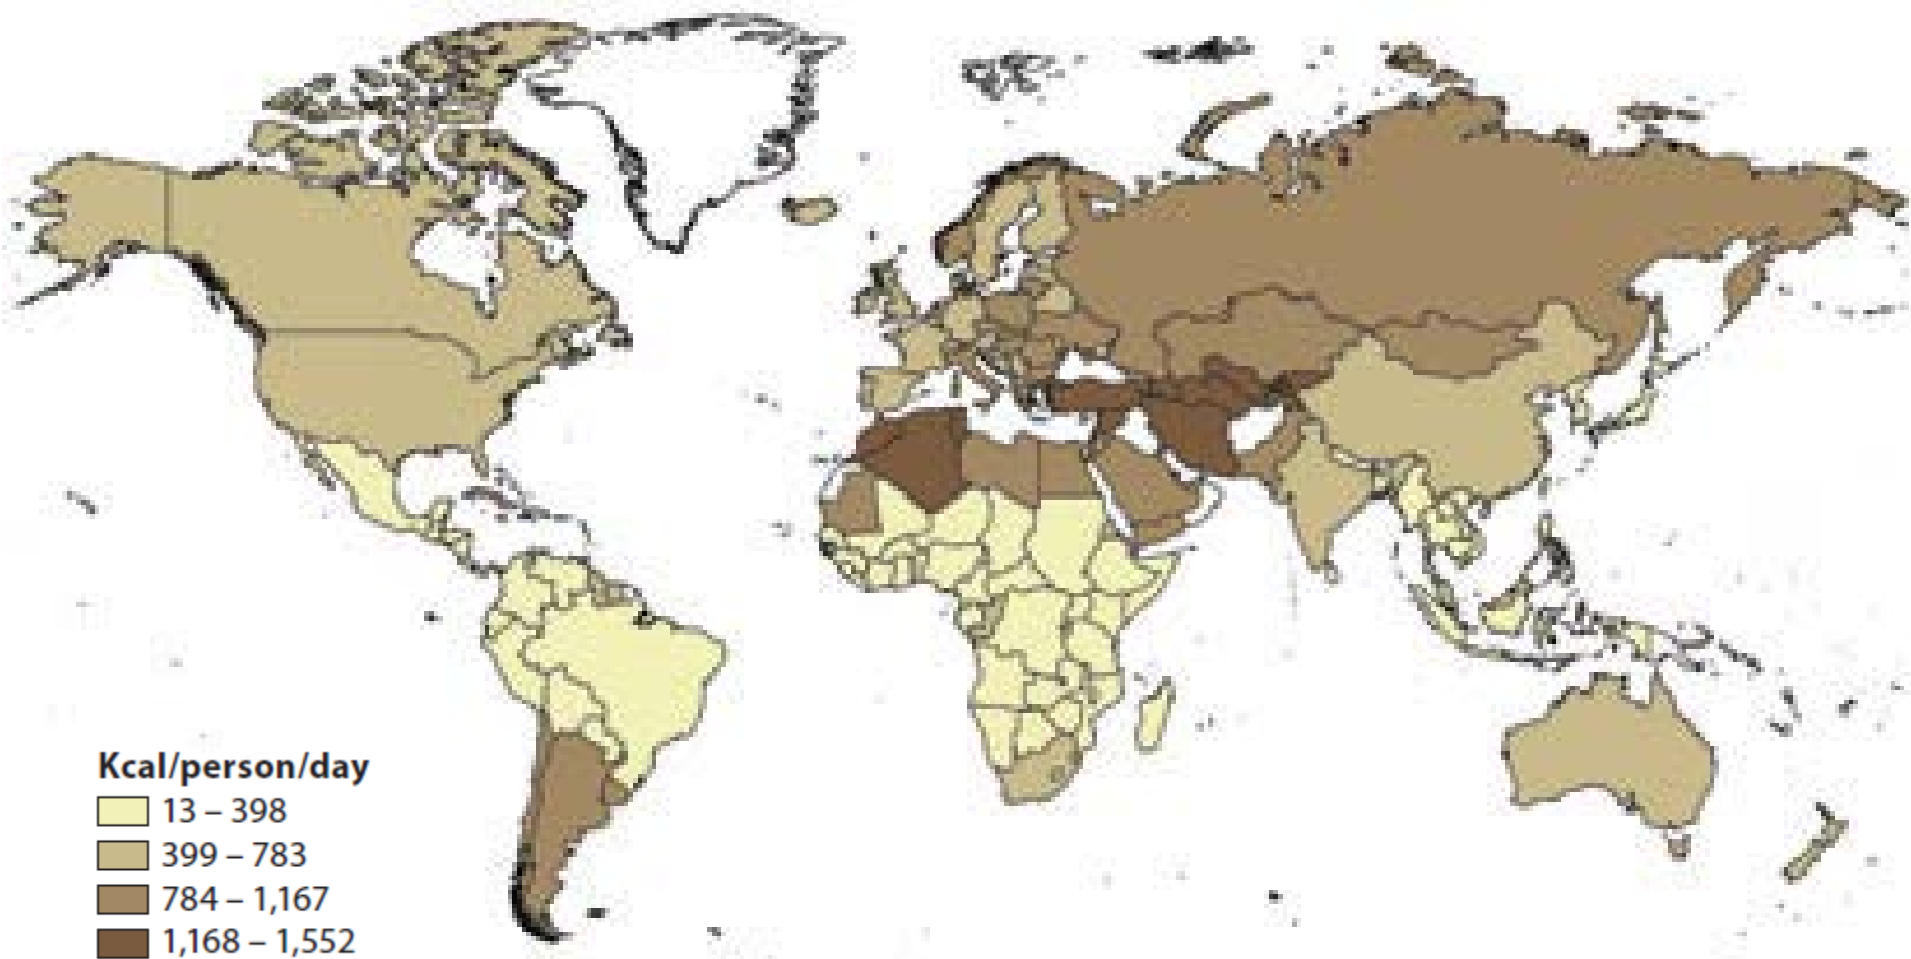

# Prevalence of celiac disease

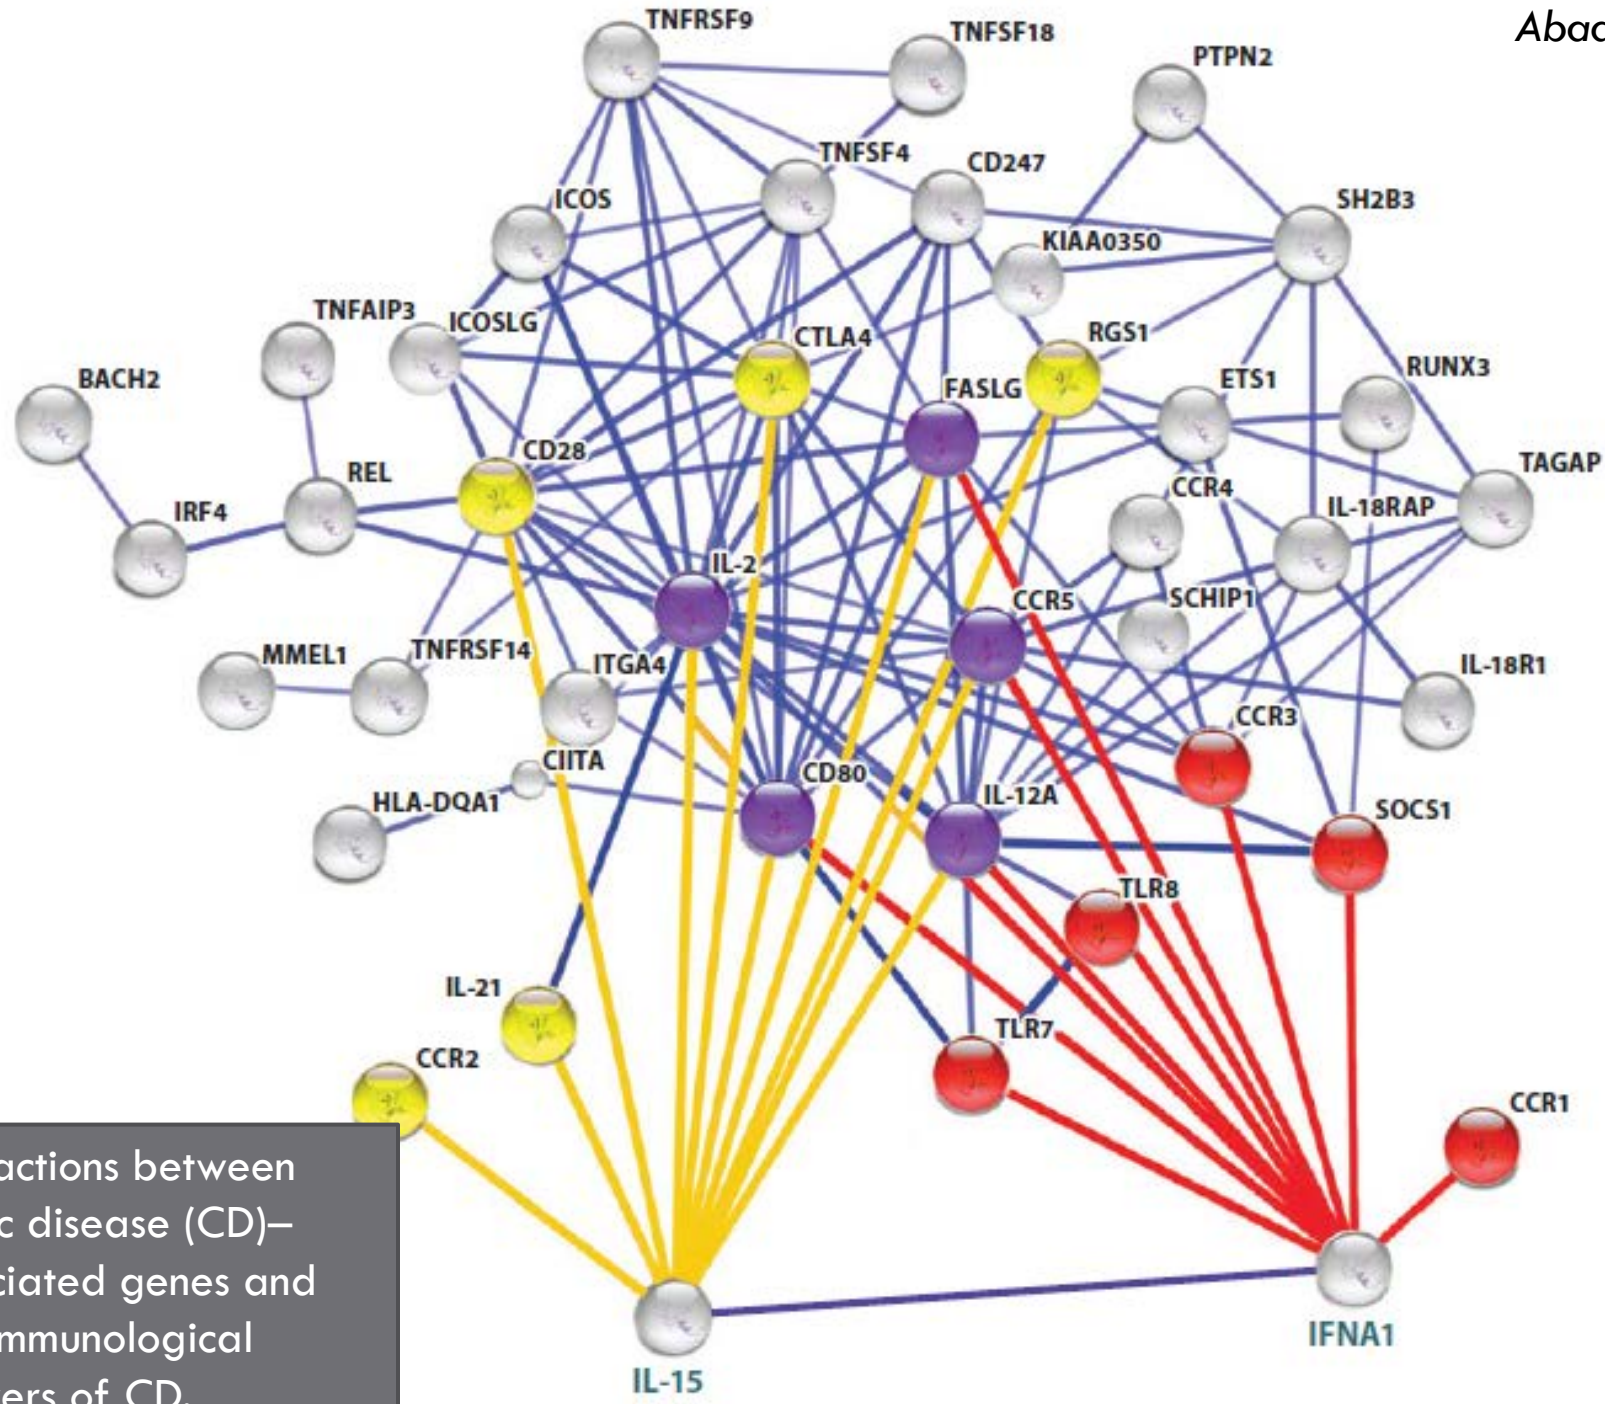

9

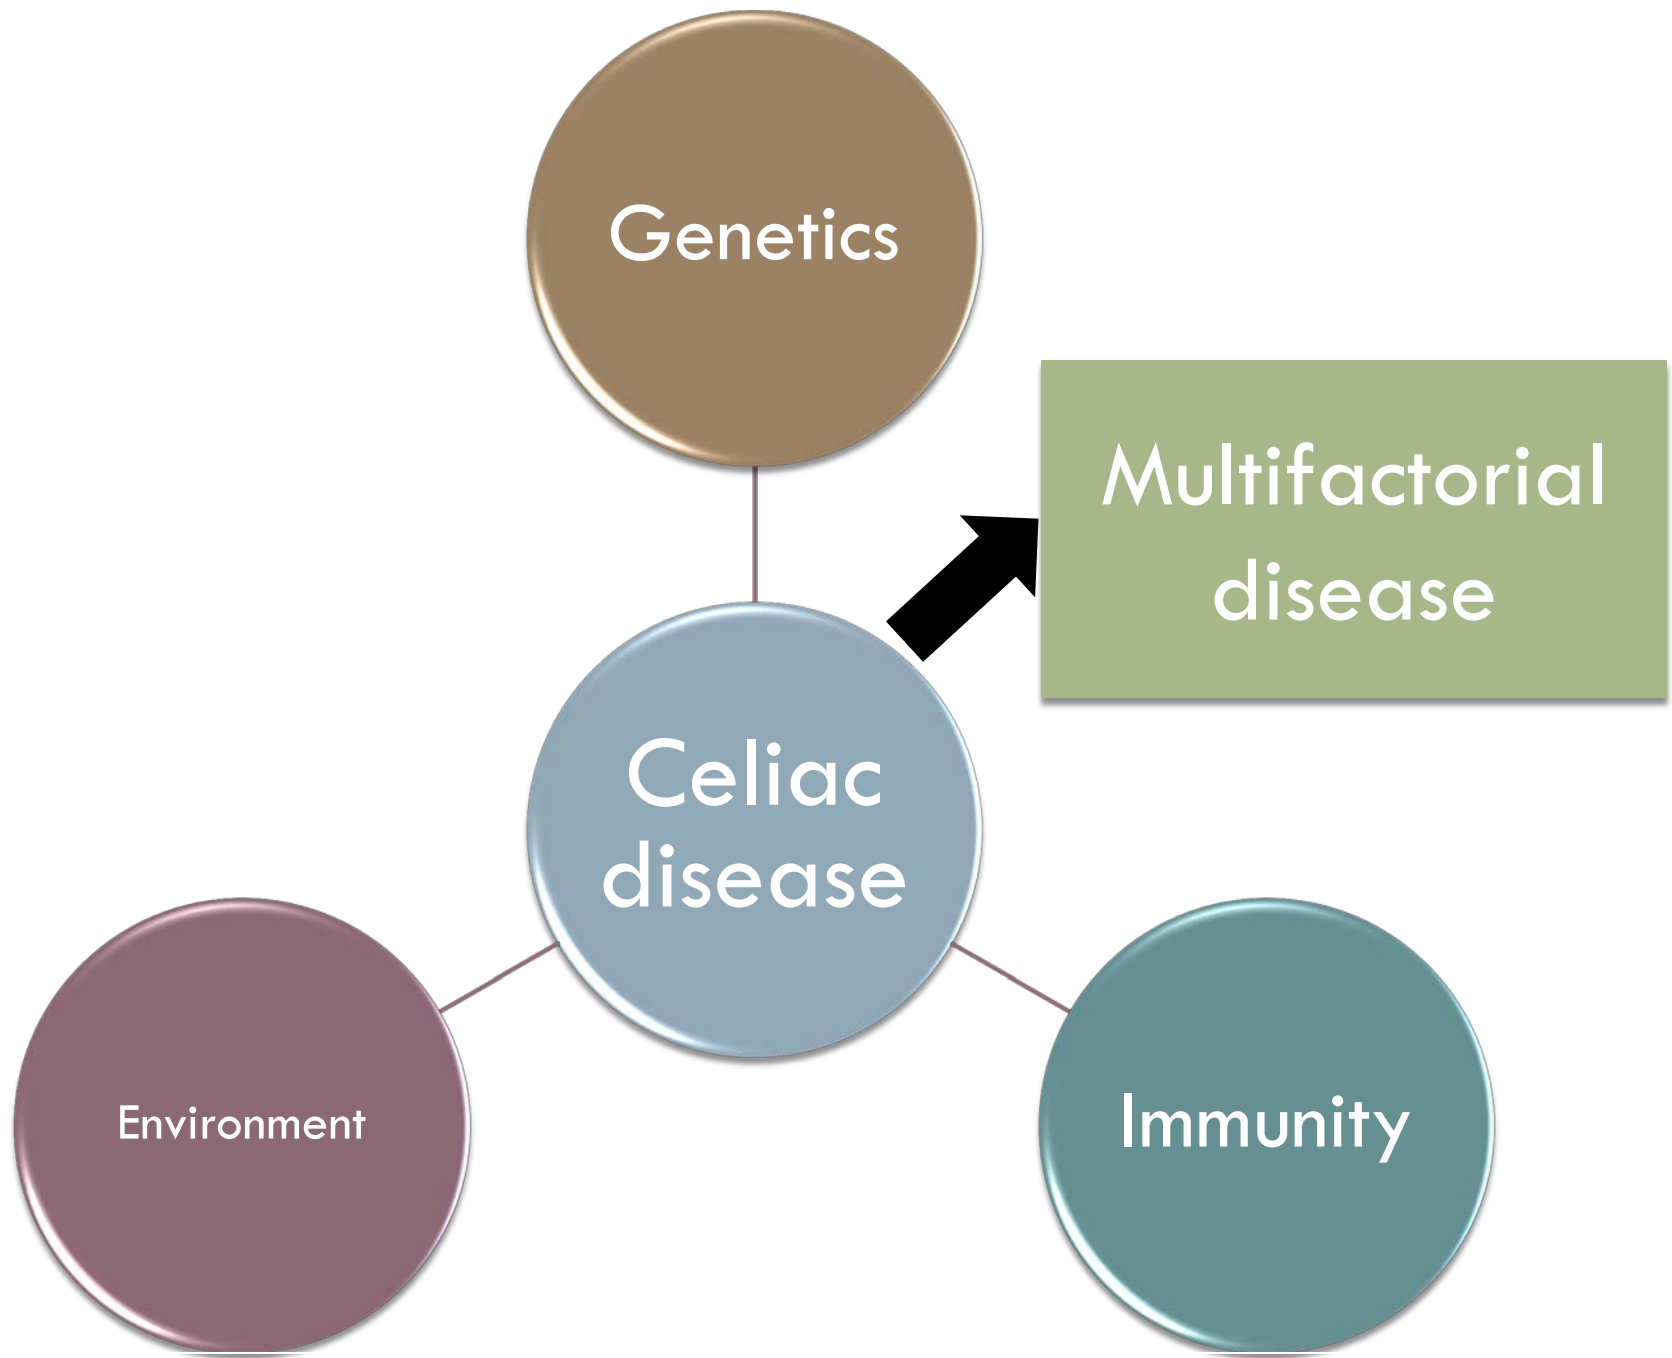

# Wheat consumption

10

Interactions between celiac disease (CD)-associated genes and key immunological markers of CD.

# Clinical manifestation

13

- ❑ Intermittent diarrhea
- ❑ Abdominal pain
- ❑ Bloating

- ❑ Irritability or depression
- ❑ Stomach upset
- ❑ Joint pain
- ❑ Muscle cramps

**Nonspecific**

- ❑ Anemia
  - ❑ Osteoporosis
  - ❑ Neuropathy
- Malabsorption,  
common**
- ❑ Skin rash
  - ❑ Mouth sores
- Dermatitis  
herpetiformis**

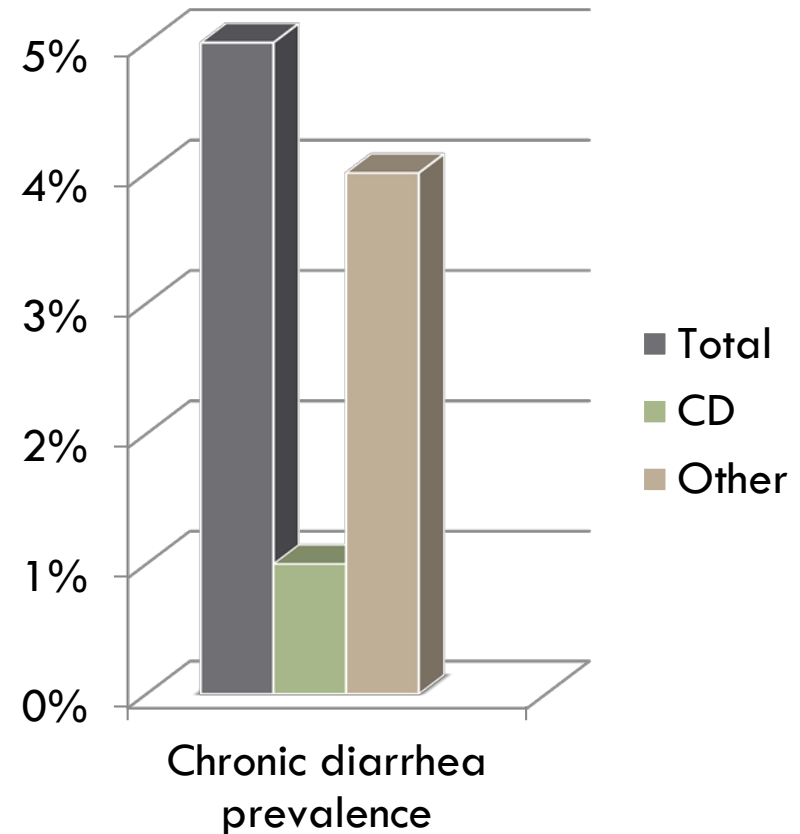

[p://fe.blog.images.s3.amazonaws.com/2010/04/ceciac\\_iceberg.jpg](http://fe.blog.images.s3.amazonaws.com/2010/04/ceciac_iceberg.jpg)

# Abdominal symptoms

14

- **Villous atrophy/ damage**
  - **Chronic diarrhea**
    - $\geq 3$  watery or loose bowel movements in a 24h
    - $\geq 4$  weeks
    - Osmotic type
      - Water to be pulled into the gut
      - Steatorrhea (diarrhea with high fat content)

- Abdominal bloating
- Abdominal pain

**Malabsorption**

# Malabsorption

15

## □ Total malabsorption

□ Vitamins

□ Minerals

□ Proteins

□ Fats

Anemia

Osteoporosis

Neuropathy

Weight loss  
& weakness

Steatorrhea

Ca, P, Fe, vit A  
B D E K, Folate

Lipids, sugar,  
amino acids,  
small peptide

Vit C B(12) D K

Enterocytes

goblet cell

# Comparing normal and abnormal

20

**Normal histology, long villi**

**Abnormal histology, short and bland (atrophic) villi, celiac disease**

# Microscopic findings in CD

21

- Intraepithelial lymphocytes
- Increase in plasma cells in lamina propria
- Atrophy or total loss of villi
- Fat globules in surface epithelium
- Enterocytes have stratified nuclei
- Crypt hyperplasia

Fig. 2. *Duodenal biopsy*. Complete villous atrophy. The surface epithelium exhibits short cells lacking basal polarity. Intraepithelial lymphocytes amongst them. Lamina propria densely infiltrated with lymphocytes and plasma cells.

# Modified Marsh classification used in CD histologic grading

22

- Duodenal and jejunal biopsy – gold standard for CD diagnosis
  - Marsh 0-1
    - Consider early phase disease
    - Follow-up testing on normal diet
    - Consider false-positive results
  - Marsh  $\geq 2$ 
    - Celiac disease confirmed

23

# Skin manifestation

# Dermatitis herpetiformis

24

- Pruritic vesicles
- Symmetric
  - ▣ Extensor surfaces
  - ▣ Rare mucous membrane involvement
- Microscopy
  - ▣ Subepidermal blisters
  - ▣ Neutrophilic microabscesses in papillary dermal tips
  - ▣ Lymphocytic infiltrate around superficial vascular plexus

# Dermatitis herpetiformis

25

- Incidence – 10-39/100,000
- Age – all ages; peak onset is 20s-40s
  - ▣ Most common autoimmune bullous disease of childhood
  - ▣ Strong association with HLA-DQ2
- Diagnostic: granular IgA and C3 in papillary dermal tips
- Treatment: gluten free diet, dapsone or sulfapyridine

26

# What is Gluten?

Pathophysiology

# WHAT IS GLUTEN?

27

## PROTEIN

- PROLAMINS
  - ▣ 15% proline and 35% glutamine

Gluten - 75% and remainder being starch and lipids

- Storage
  - ▣ Elasticity and extensibility

# GLUTEN composition

28

Peptides similar to gliadin are in Rye and Barley

wheat

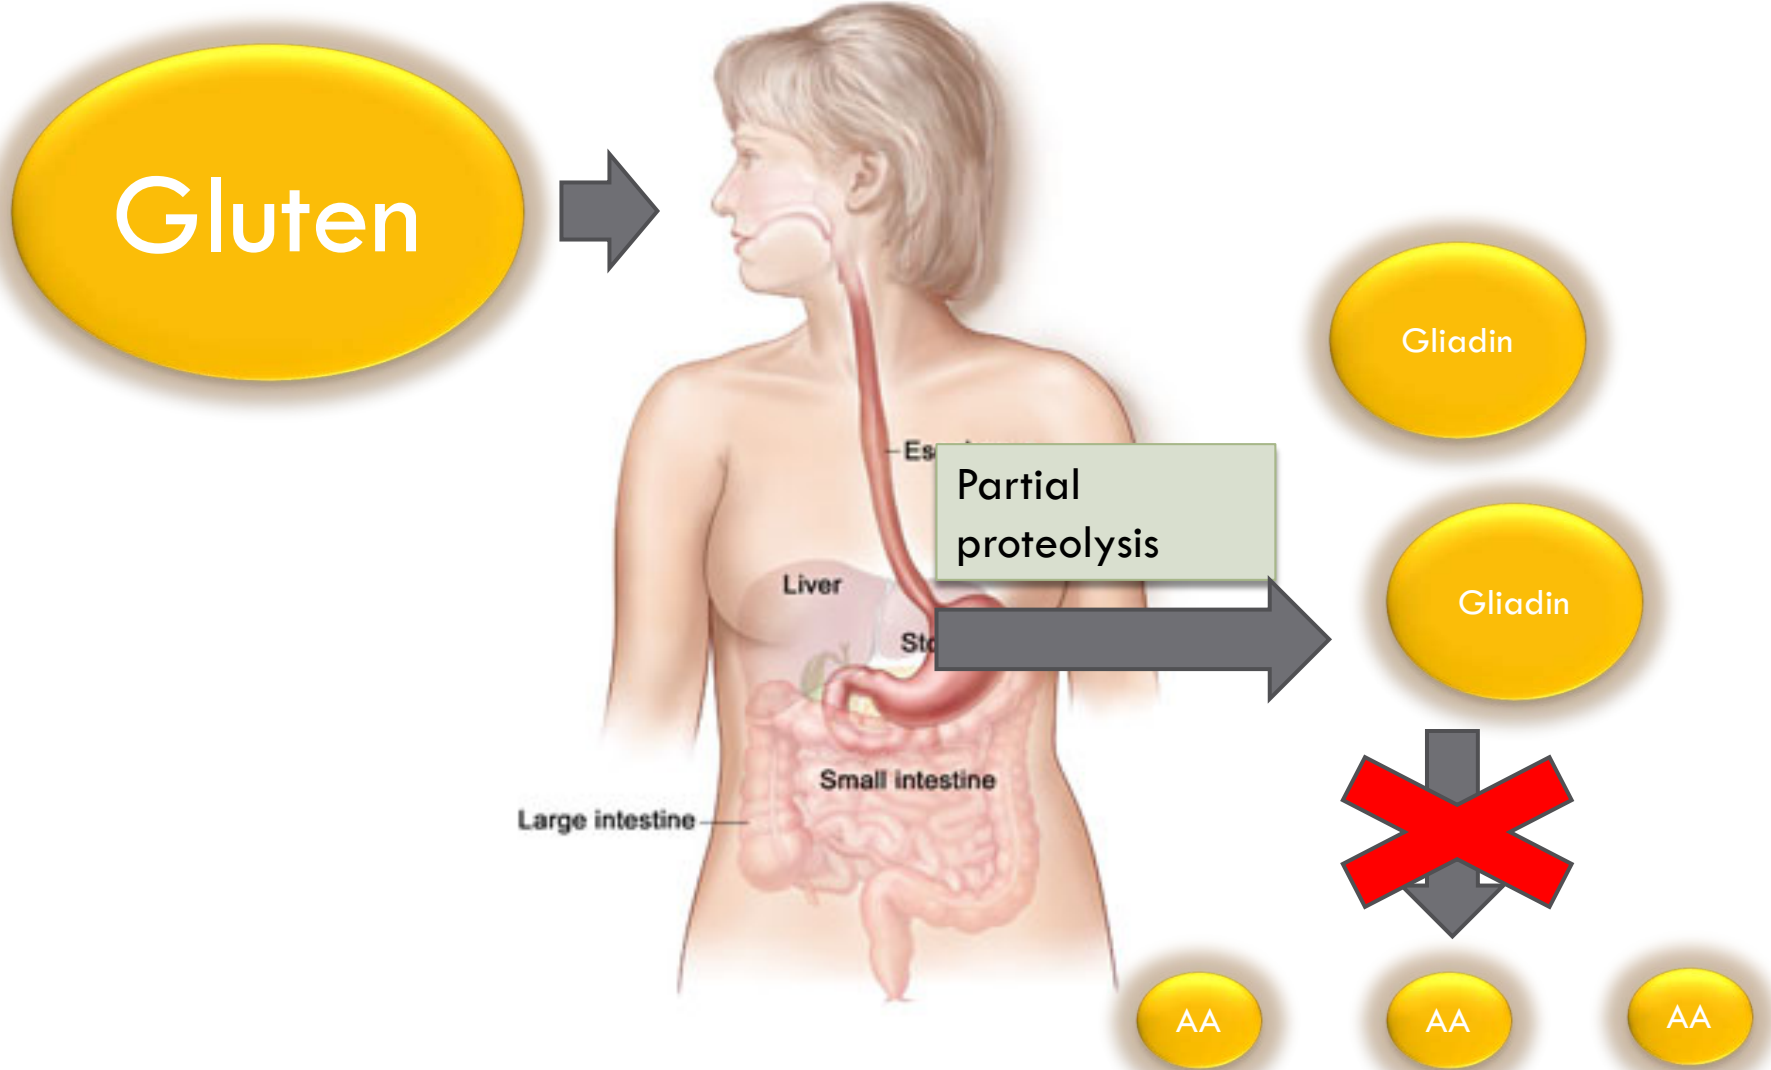

rye

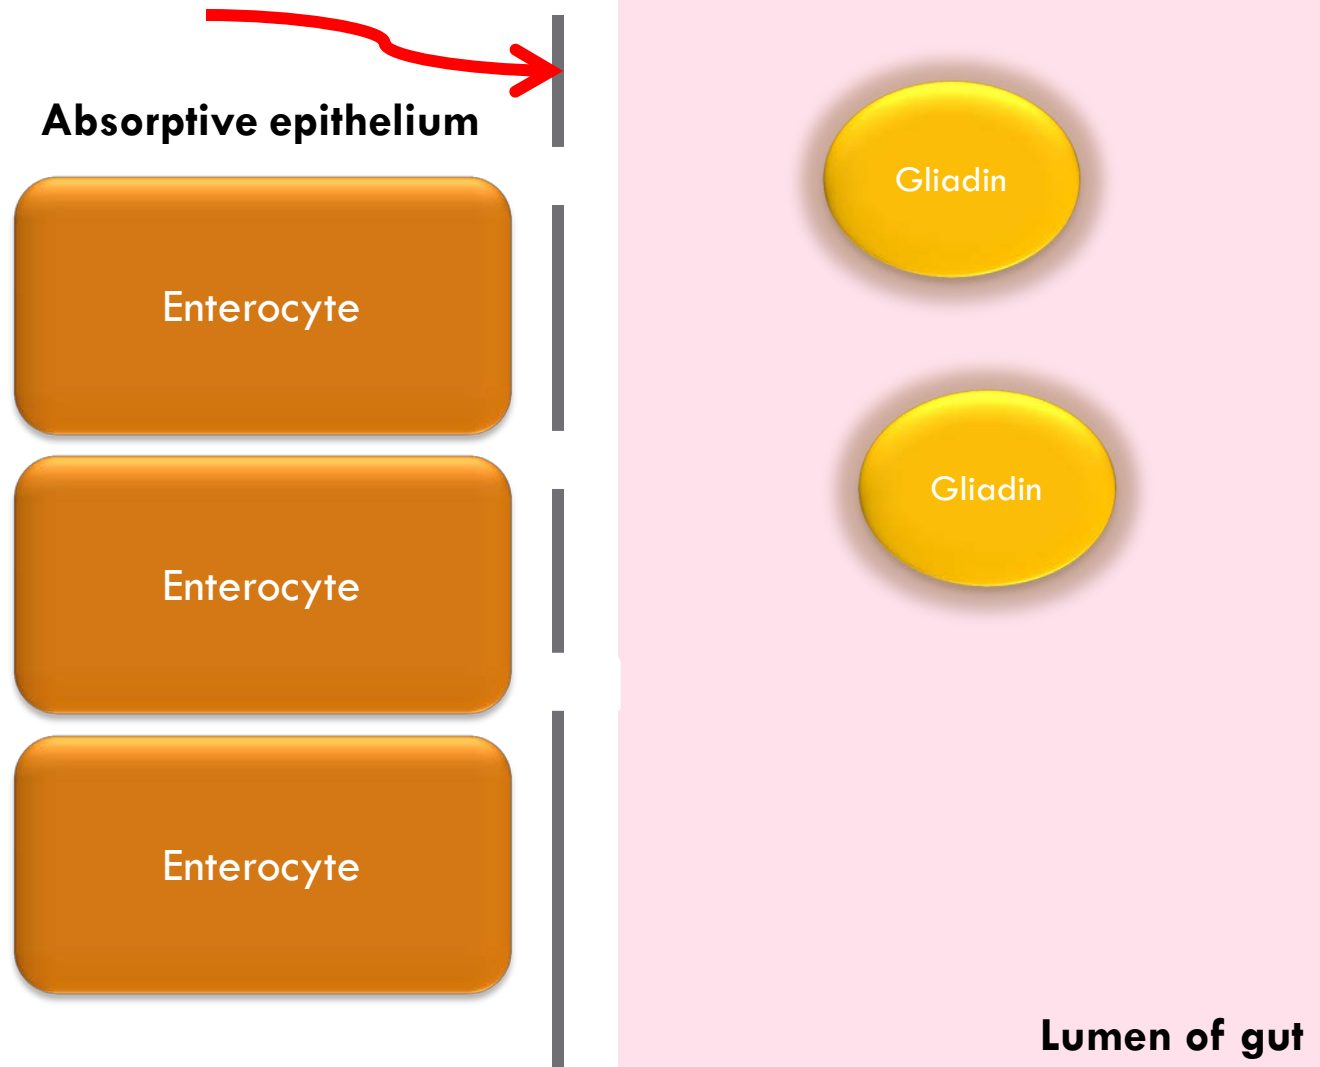

barley

# Digestion

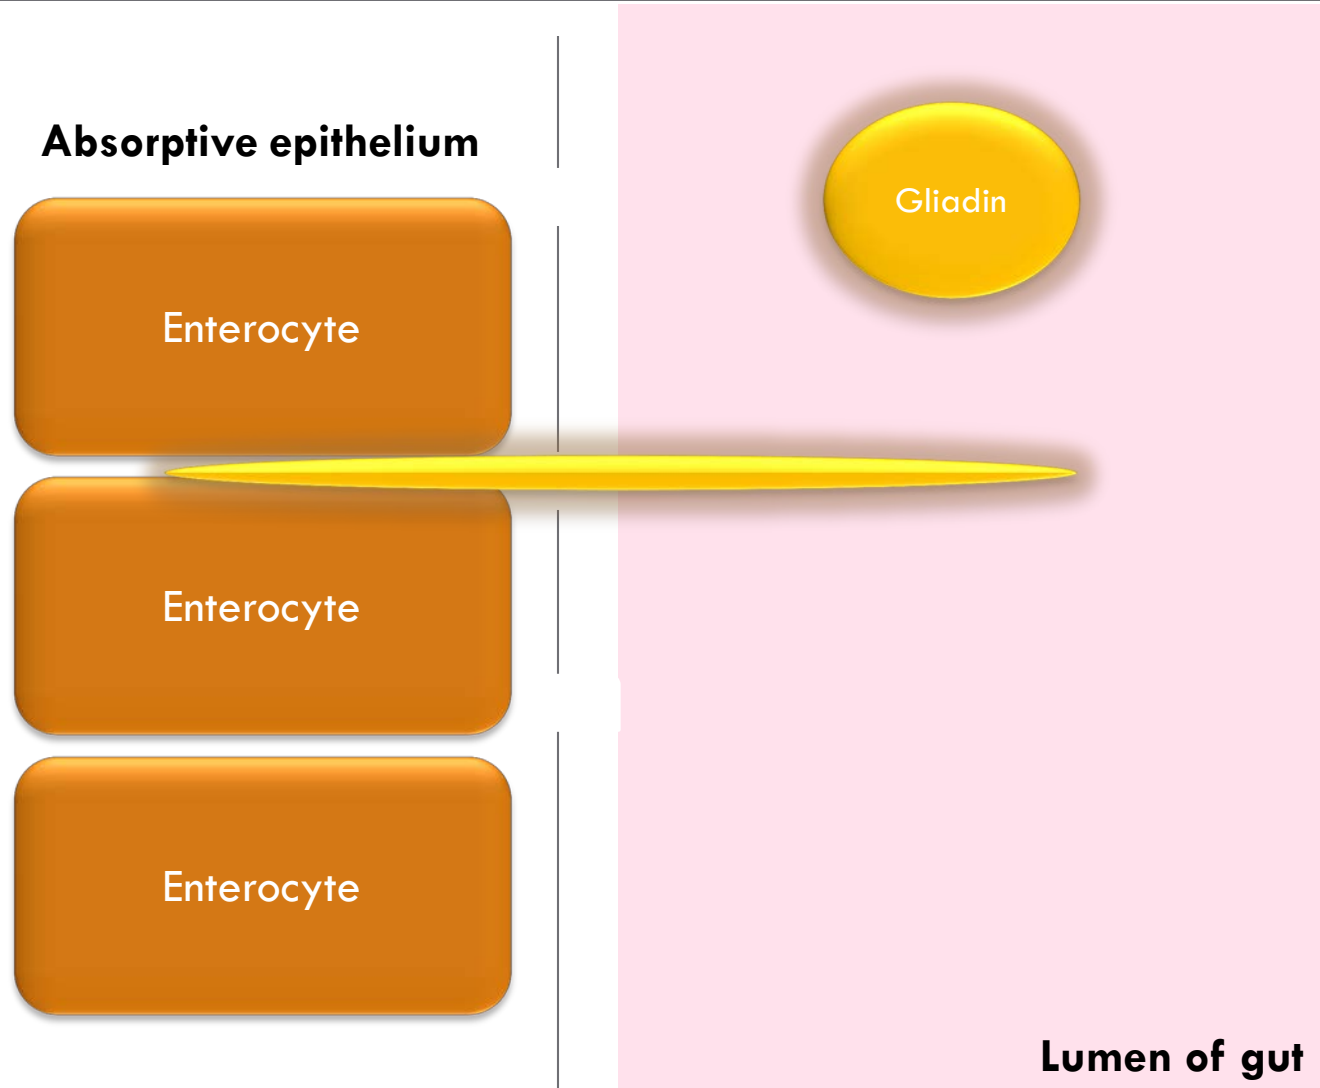

# Pathophysiology

# Pathophysiology

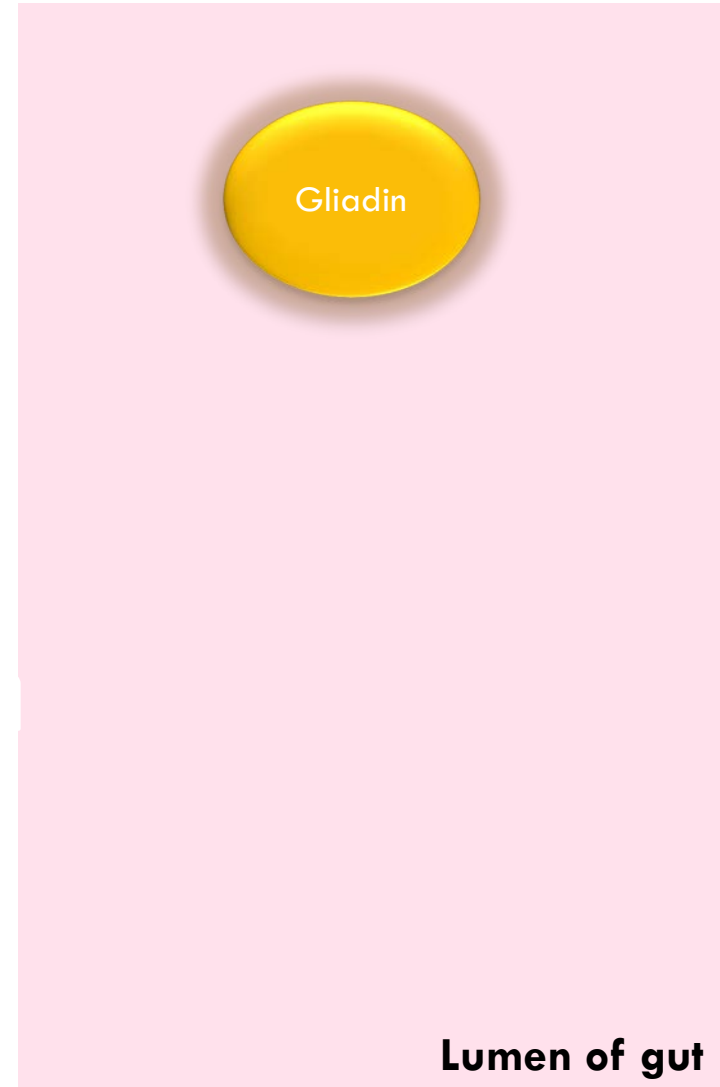

31

# Pathophysiology

32

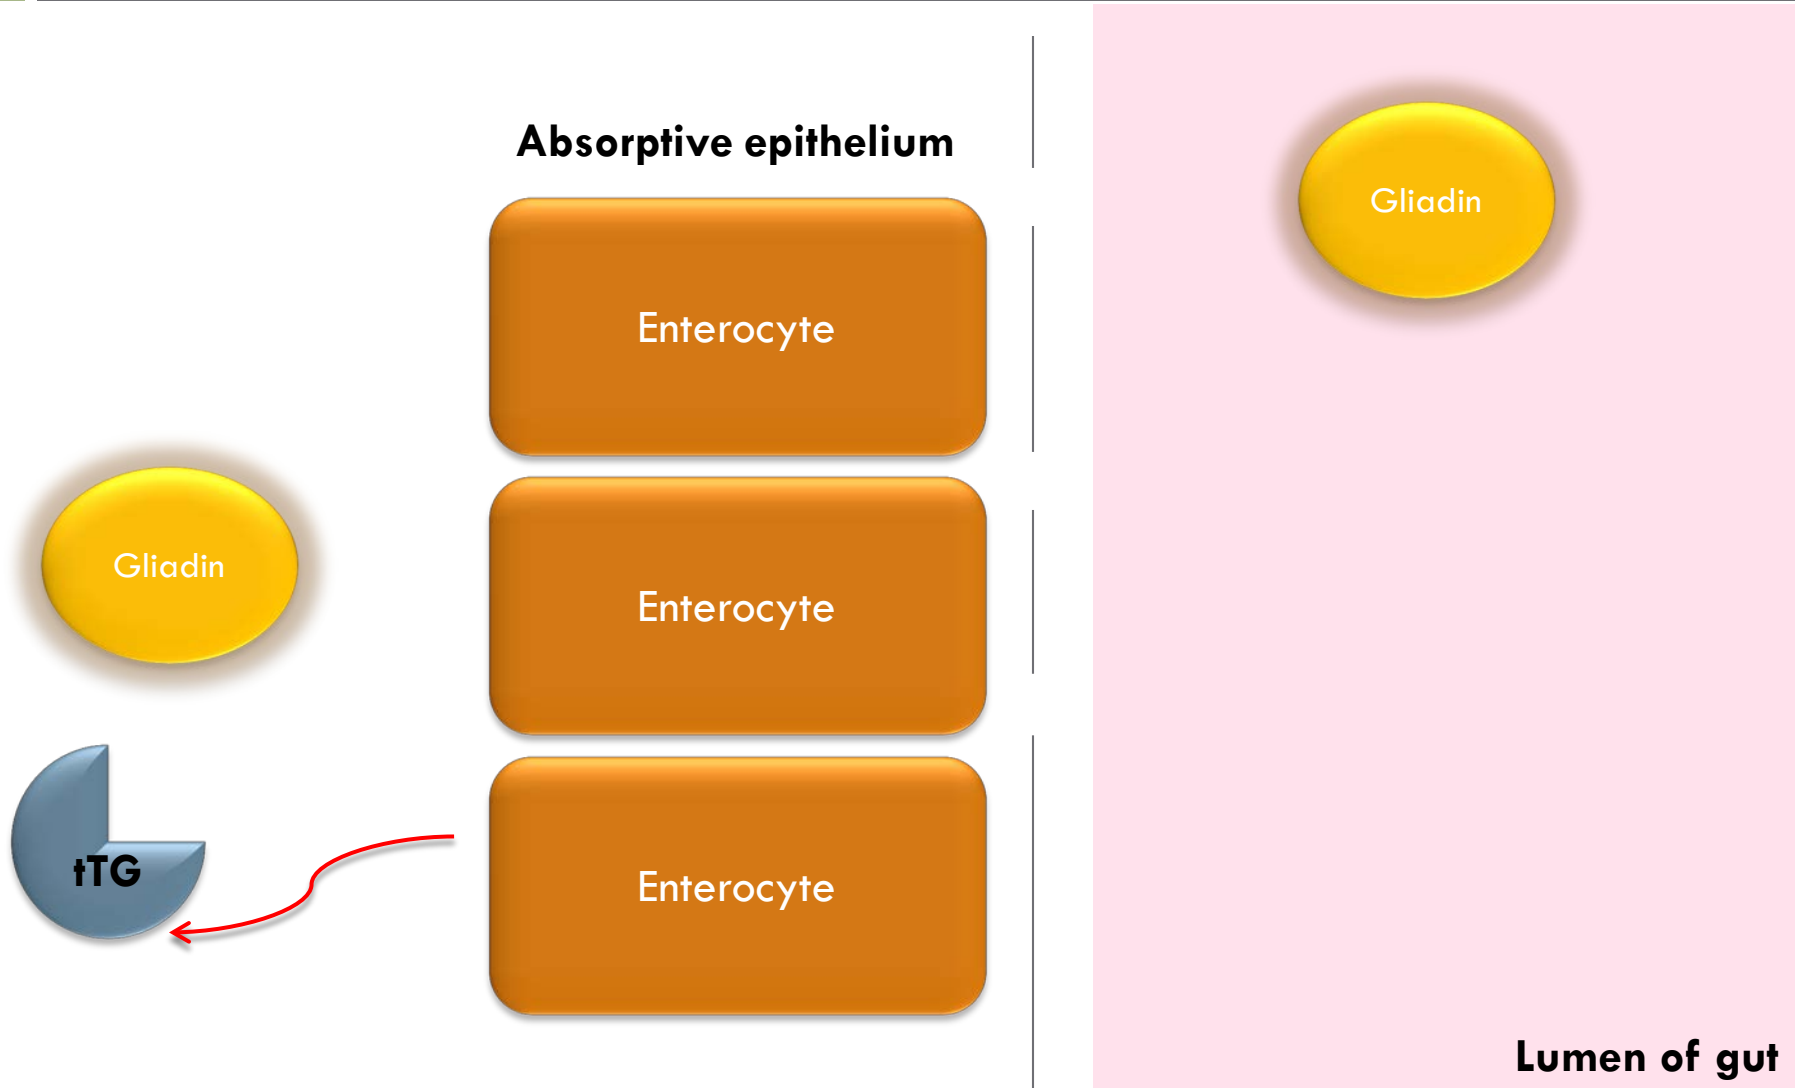

## Absorptive epithelium

39

**Lumen of gut**

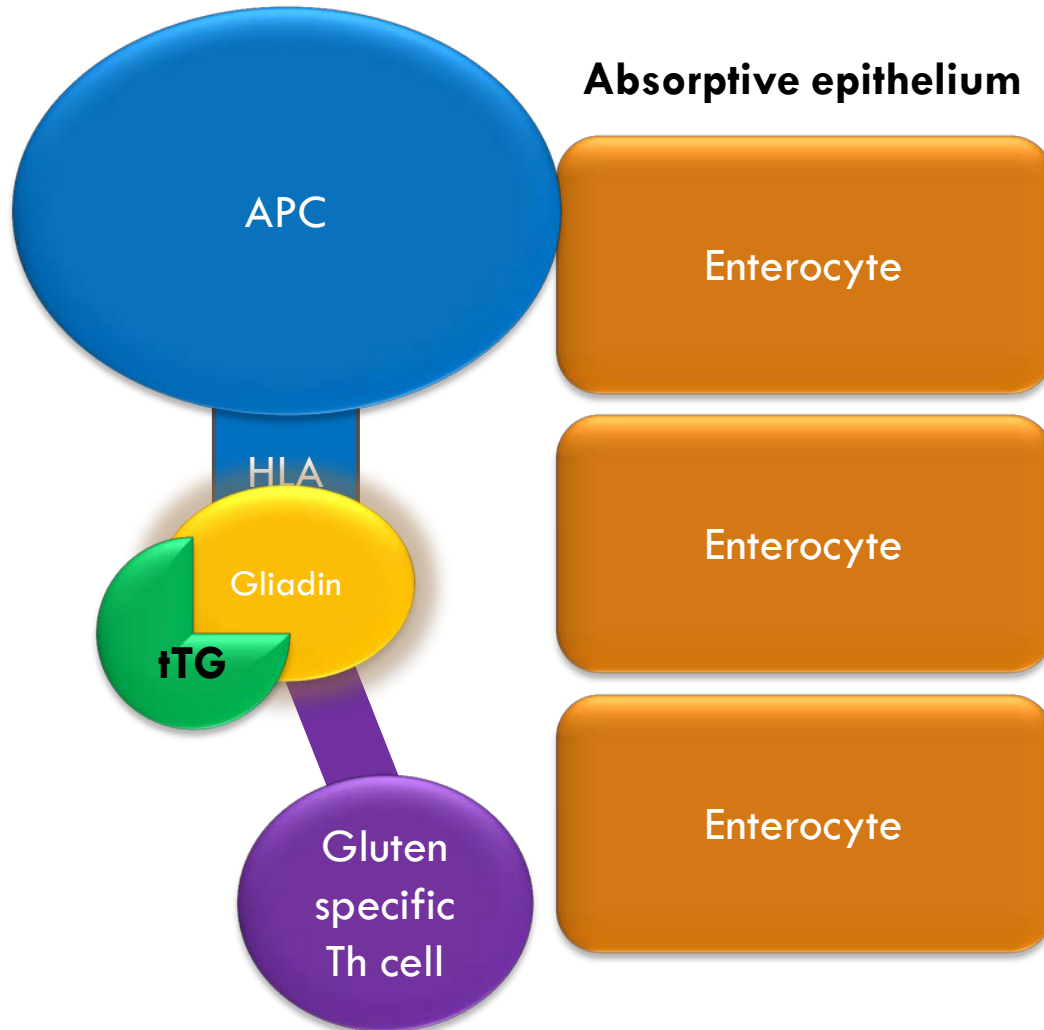

# Pathophysiology

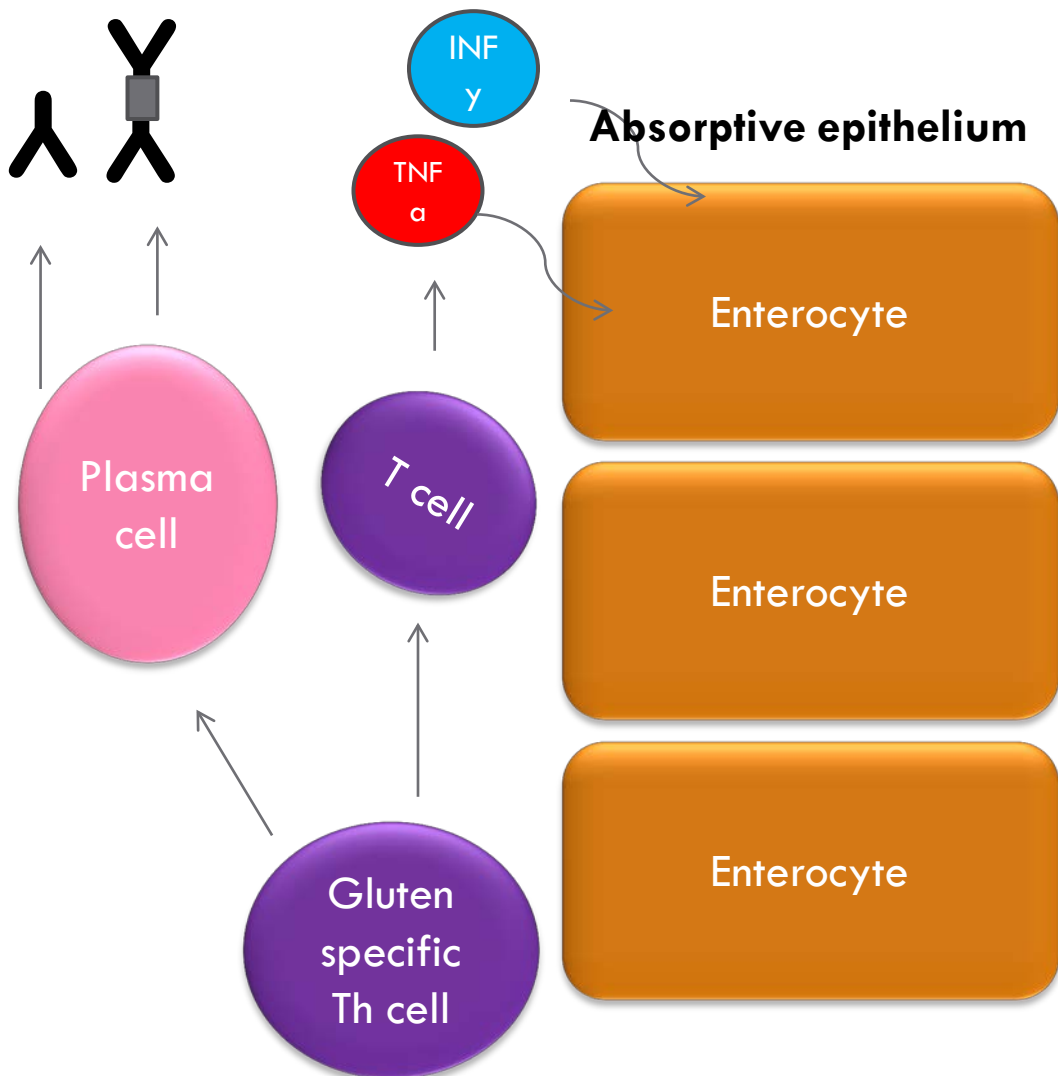

# Pathophysiology

41

# Pathophysiology

42

Th cell interacts with cytotoxic cells to facilitated cellular damage via release of INF $\gamma$  and TNF $\alpha$ .

Th cell interacts with B cell to stimulate plasma cells that produce anti-gluten antibodies.

**Lumen of gut**

# Pathophysiology

43

Th cell interacts with cytotoxic cells to facilitated cellular damage via release of **INF $\gamma$**  and **TNF $\alpha$** .

The number of intraepithelial lymphocytes increase.

The number of plasma cells in lamina propria increase.

**Lumen of gut**

# Selective IgA immunodeficiency

44

- Selective IgA immunodeficiency
  - ▣ The most common primary immunodeficiency
    - 1 in 223-1000
  - ▣ Serum IgA level of less than 5-10 mg/dL
  - ▣ Recurrent infections and bronchiectasis
  - ▣ Allergy
  - ▣ Increased risk of developing atopic or autoimmune disease
    - Including celiac disease

# Serologic tests for antibodies

45

# Endomysial Antibody (EMA)

46

## Identified antigen for EMA Endomysial Antibody

- ▣ Endomysial component of smooth muscle layers or connective tissue stroma covering individual muscle fibers
- ▣ Intracellular tissue transglutaminase (tTG)

**Table 1** Enzyme-linked immunosorbent assay (ELISA) based on tTG for the celiac disease (CD) autoantigen

Serum sample	EmA titer	Serum IgA anti-tTG dilution (1:400)
CD A	(1:640)	>3.500
CD B	(1:320)	>3.500
CD C	(1:320)	3.114 ± 0.024
CD D	(1:320)	1.257 ± 0.024
CD E	(1:320)	1.977 ± 0.018
CD F	(1:320)	1.525 ± 0.085
CD G	(1:160)	1.208 ± 0.019
CD H	(1:160)	0.747 ± 0.048
CD I	(1:160)	2.174 ± 0.291
CD K	(1:80)	0.667 ± 0.037
CD L	(1:80)	1.372 ± 0.093
CD M	(1:40)	0.286 ± 0.009
Ulcerative colitis	(ND)	0.119 ± 0.014
Indeterminate colitis	(ND)	0.092 ± 0.016
Crohn's disease	(ND)	0.090 ± 0.001
Sjögren's syndrome	(ND)	0.137 ± 0.004
Sjögren's syndrome	(ND)	0.082 ± 0.003
Alcoholic liver fibrosis	(ND)	0.059 ± 0.001
Healthy control	(ND)	0.070 ± 0.001

# Endomysial Antibody (EMA)

47

- Labor intensive
  - ▣ Reading errors
- Expensive
- May be used for confirmation if anti-tTG is equivocal
  - ▣ Very specific\*
  - ▣ Acceptable screen
  - ▣ High positive predictive value for active CD

# Reticulin Antibody, IgA and IgG

48

- IgG class reticulin antibodies bullous dermatoses and other diseases, and sometimes in normal patients
  - ▣ Reticulin is a type of fiber composed of type III collagen
- Not recommended for CD testing
- IgA 25% dermatitis herpetiformis
- IgA 60% celiac disease

49

# Methodology

## **Indirect Fluorescent Antibody (IFA)**

# Indirect Fluorescent Antibody (IFA)

50

# Indirect Fluorescent Antibody (IFA)

51

# Indirect Fluorescent Antibody (IFA)

52

Fluorescein-labeled Antibodies (FITC)

# Indirect Fluorescent Antibody (IFA)

53

Fluorescein-labeled Antibodies (FITC)

# Indirect Fluorescent Antibody (IFA)

54

Fluorescein-labeled Antibodies (FITC)

# Immunofluorescence

# DGP, tTG and AGA antibodies

56

- **DGP and tTG are used in screening population at risk or with symptoms**
- DGP IgG antibodies more sensitive but less specific markers for disease compared with IgA class antibodies
- Anti-gliadin antibody (AGA) can be found in healthy individuals or in other bowel diseases
  - ▣ No longer a recommended test
- tTG antibody may be less reliable in children

# F-Actin (Smooth Muscle) Antibody

57

- Adjunct test
- Monitoring tool for patients with severe disease
  - ▣ Correlate with severity
- Test results alone are not diagnostic

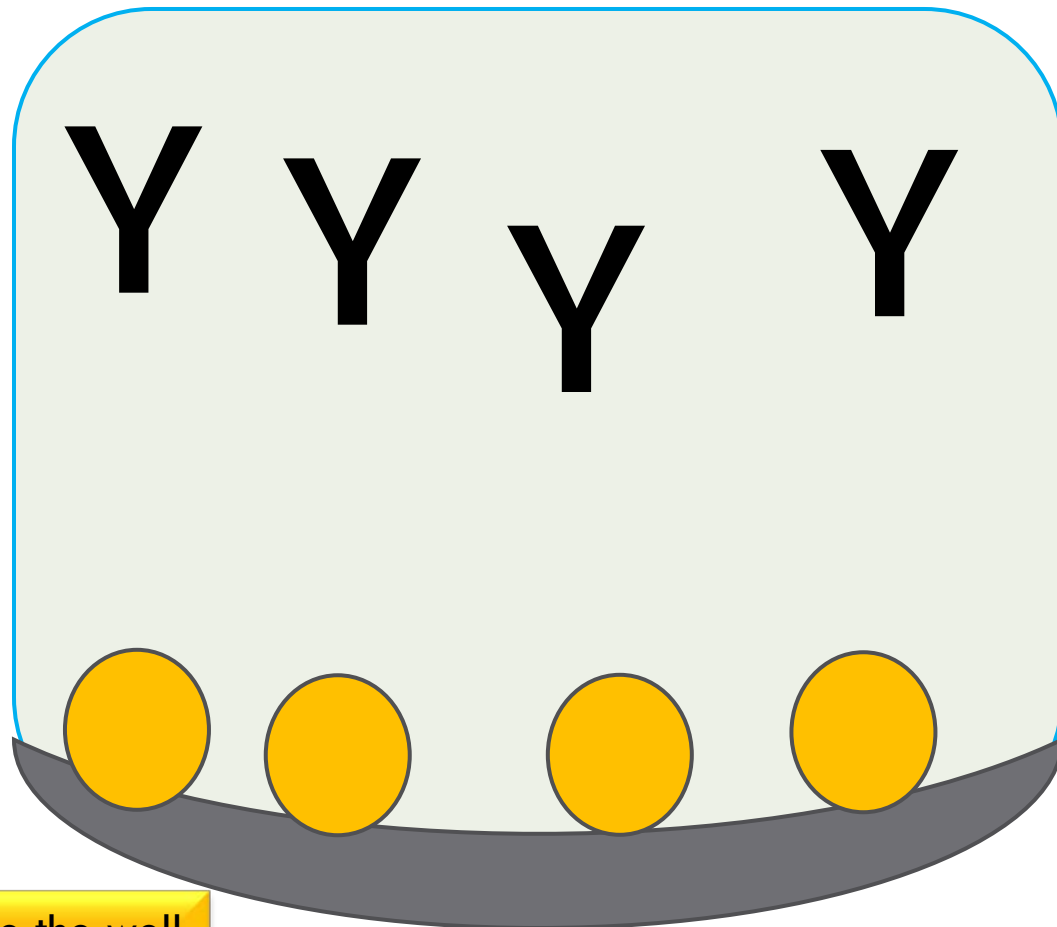

CD with partial villi atrophy	CD with total villi atrophy	Healthy controls	"Disease" controls
41/60 (69%)	123/145 (85.3%)	1/80 (1.3%)	23/81 (28%)

<b>tTG</b>	<b>ELISA</b>	<b>&gt;90%</b>	<b>&gt;99%</b>
<b>DGP</b>	<b>ELISA</b>	<b>&gt;90%</b>	<b>&gt;90%</b>
<b>EMA</b>	<b>IFA</b>	<b>80-100%</b>	<b>&gt;99%</b>
reticulin Ab*	IFA	24-30%	>90%
gliadin	ELISA	75-95%	>95%

# Diagnosis of celiac disease

64

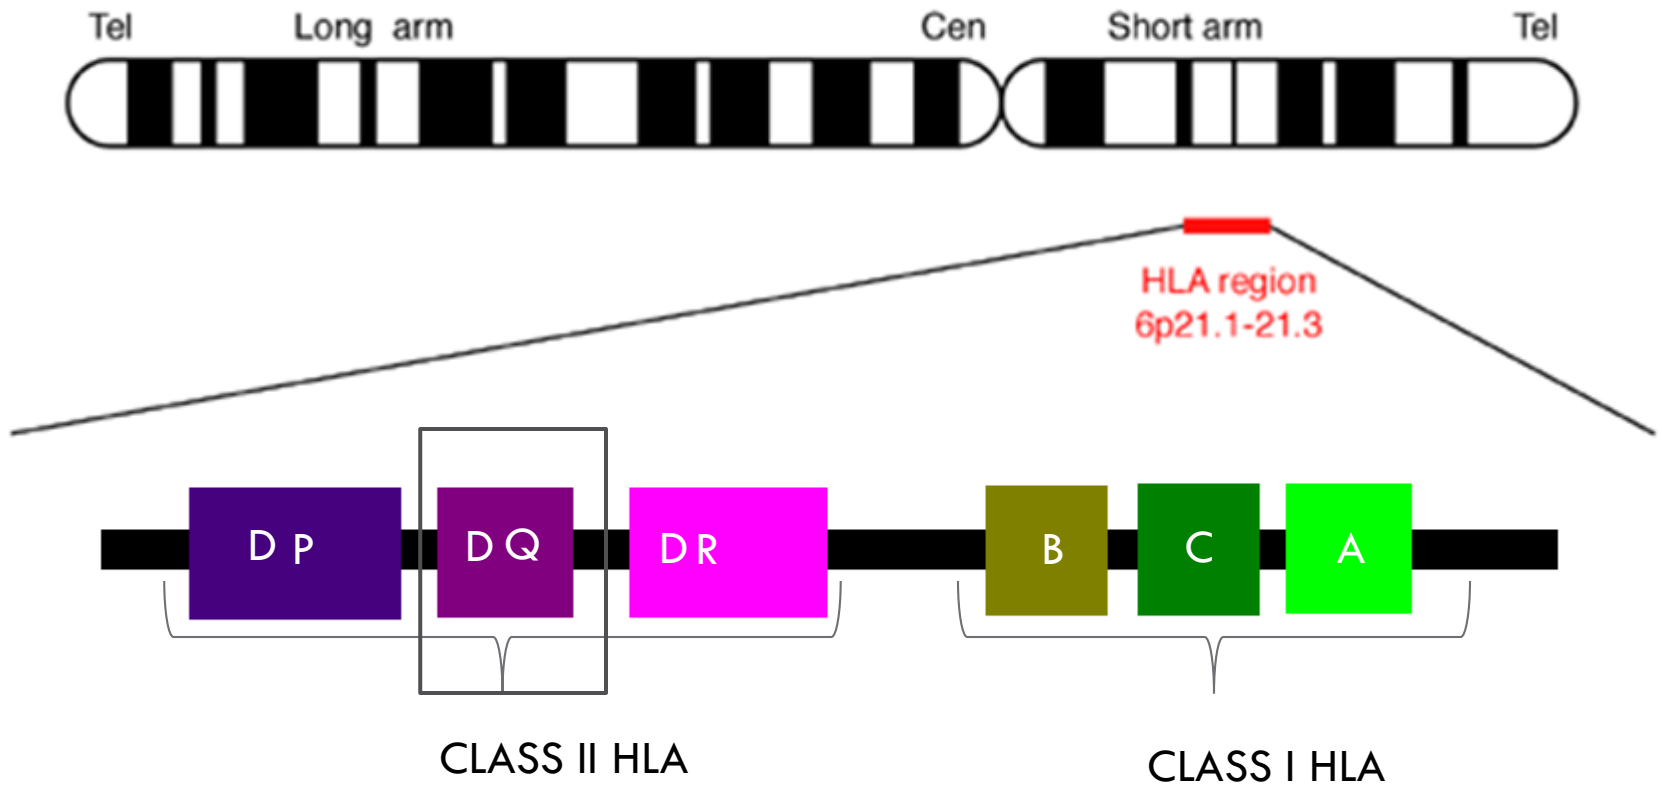

- 1 • Clinical manifestations ✓
- 2 • Antibody / serology ✓
- 3 • HLA test
- 4 • Biopsy ✓

# Major histocompatibility complex (Human leukocyte antigen - HLA)

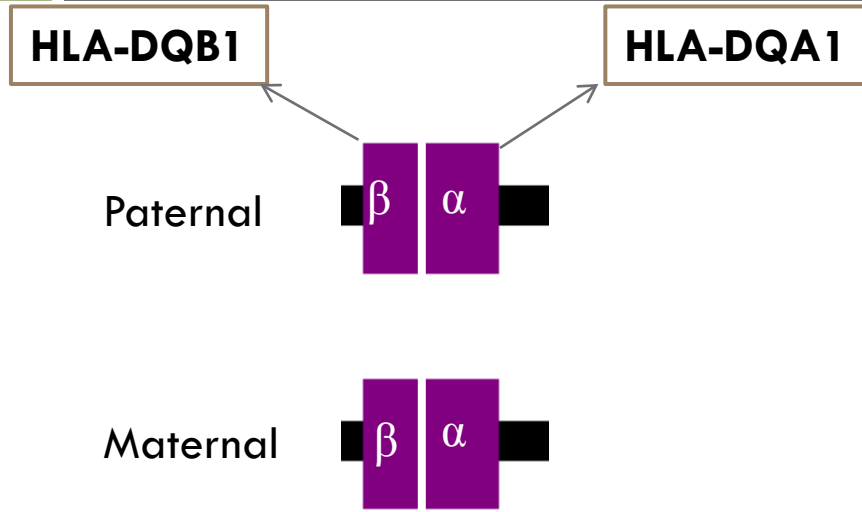

65

## Chromosome 6

# HLA-DQ as heterodimeric ( $\alpha\beta$ ) receptor

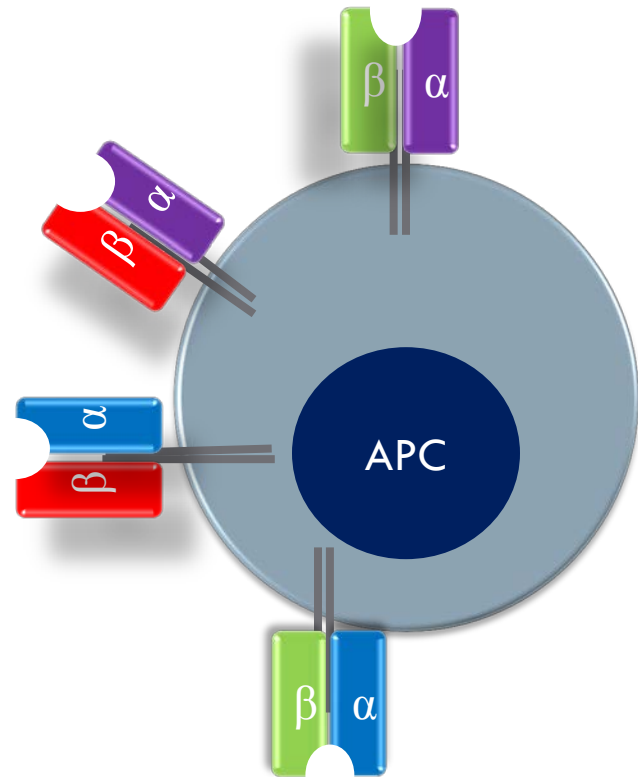

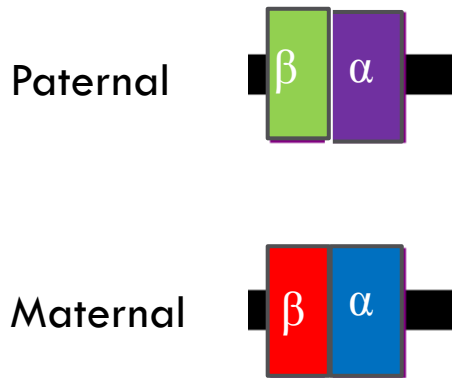

66

There are many slightly different  $\alpha$   
and  $\beta$

# Everybody has 2 HLA-DQ genes

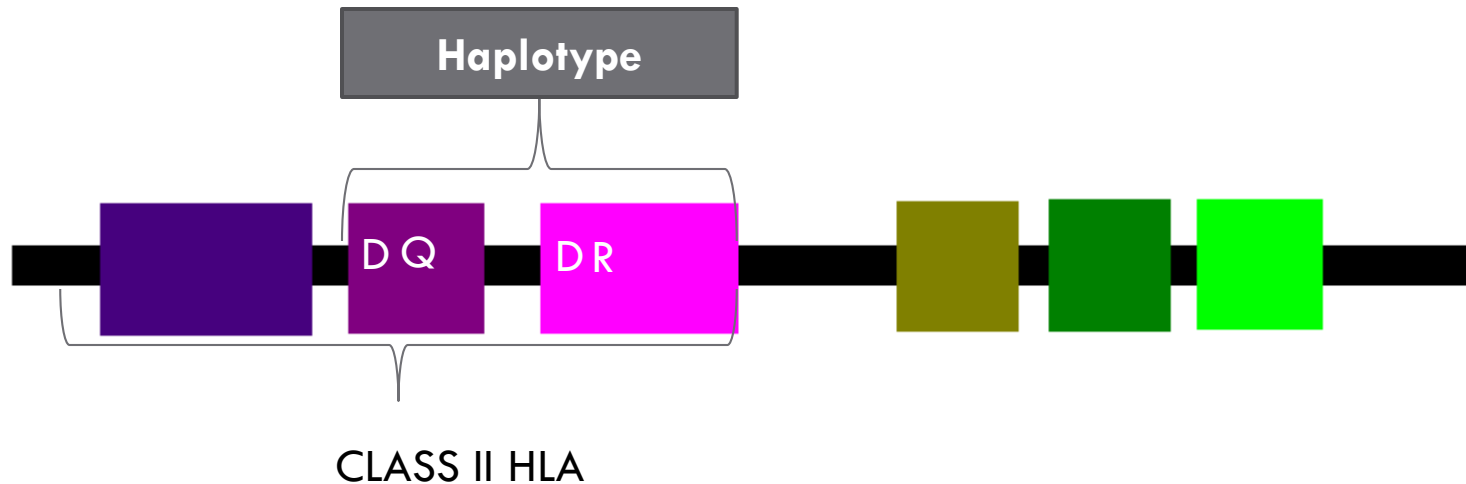

67

# Haplotype

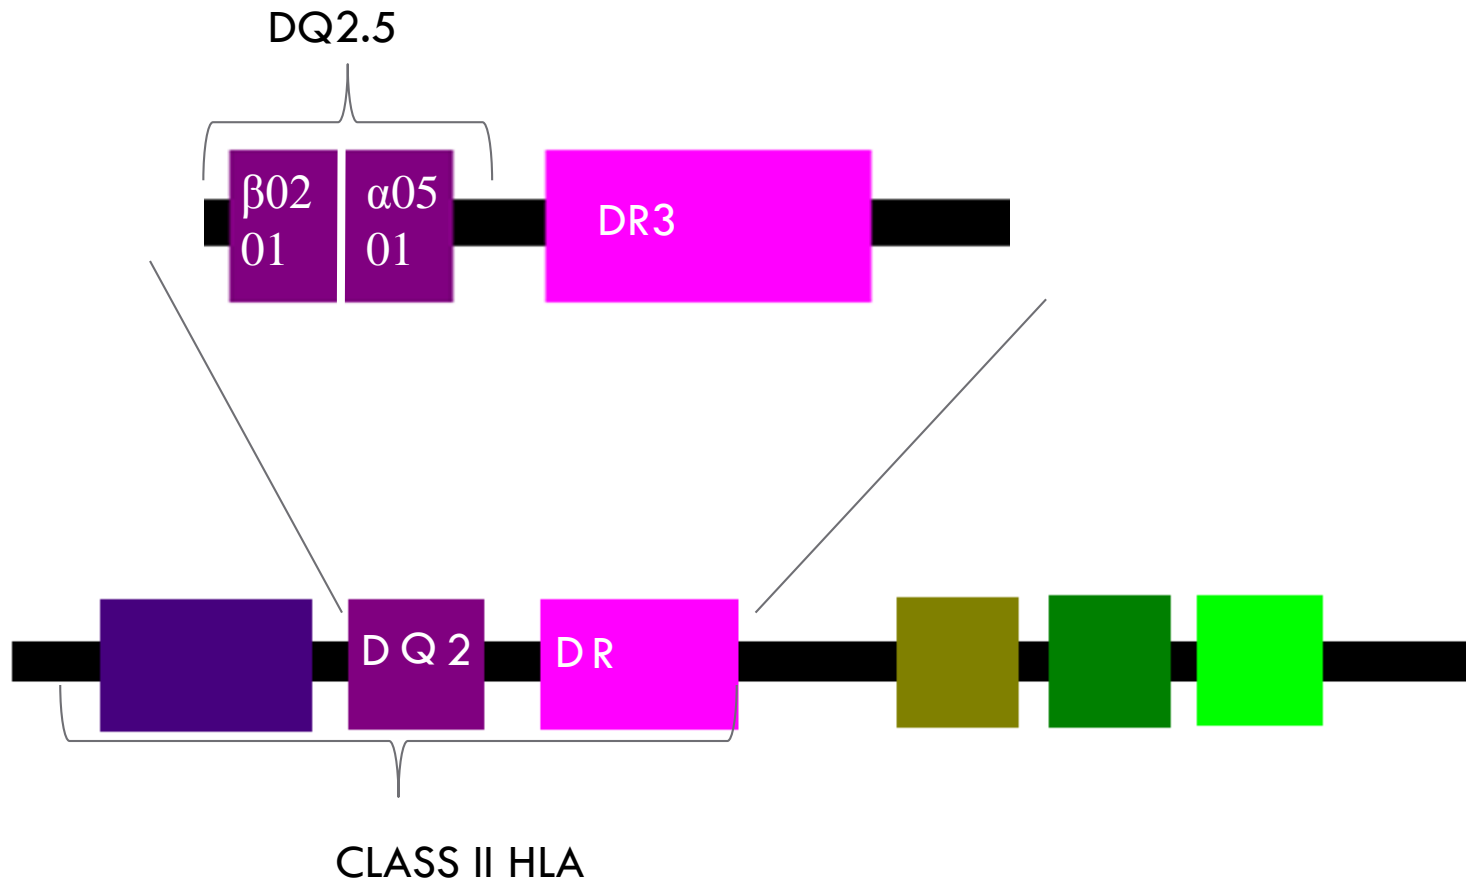

68

- **Definition:** Combination of alleles of DNA sequences at adjacent locations on the chromosome that are transmitted together

# Haplotype

69

# Haplotype

70

## □ Haplotype DR3-DQ2

- The most common haplotype associated with celiac disease
  - European prevalence up to 21.9 %
  - African prevalence of up to 17.3 %
  - Rare in Asian and Native Americans population

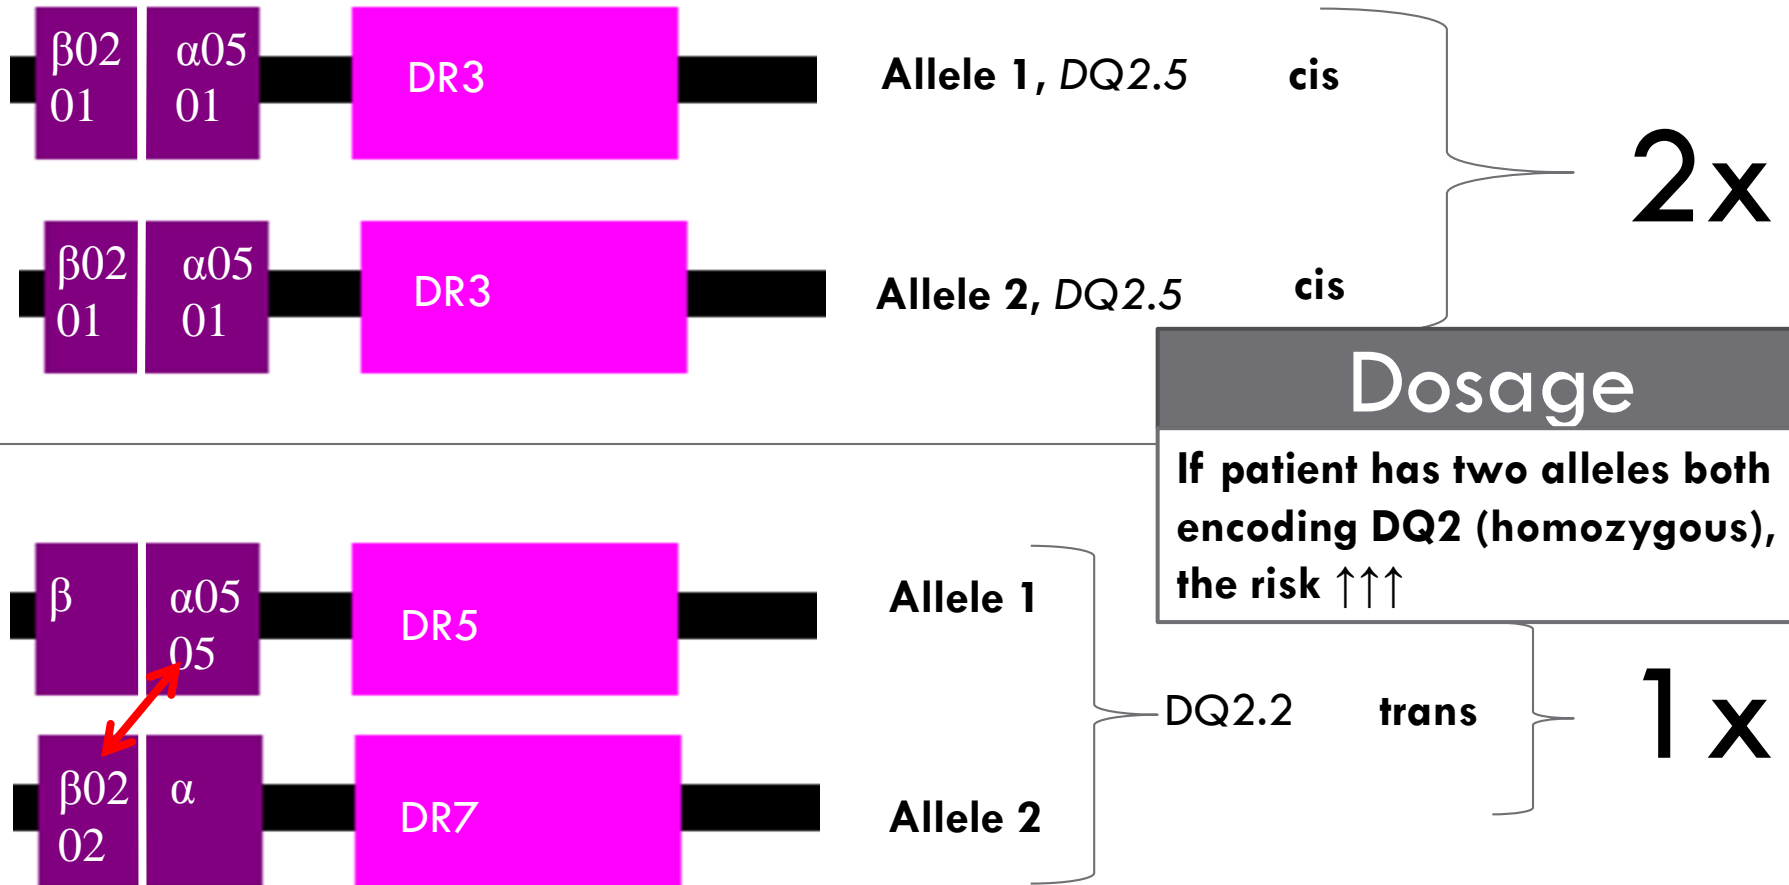

# Frequency of HLA DR3-DQ2

71

# Trans vs. cis alleles in DQ2

72

# HLA-DQ 2 and 8 predispose for CD

73

74

# Methodology

PCR with SYBR Green I technique

# PCR

75

Polymerase  
Primers:  
DQB1\*02 } **DQ2**  
DQA1\*05 }  
DQB1\*03:02 → **DQ8**  
Patient's DNA

SYBR  
Green I technique/  
fluorescent DNA binding  
dye

Fluorescence is increases upon  
binding to double-stranded DNA

Signal ↑ as the DNA  
concentration ↑

Melting analysis

# HLA summary

76

- ▣ *HLA-DQ2* is positive in 90-95% of patients with CD
- ▣ Presence does not confirm CD
- ▣ Found in 30-40% of general population
- ▣ Absence virtually excludes CD
- ▣ May be indicated in individuals at risk for CD or individuals who are repeatedly seropositive but biopsy-negative
- ▣ Results
  - HLA positive (and other serology/ clinical history +) – CD confirmed
    - Not necessary to confirm by biopsy
    - HLA negative – likely false-positive tTG test

# Screening for celiac disease

77

- Not recommended for the general population
- DGP and tTG IgA and IgG
- Utility of HLA tests:
  - Type 1 DM, Autoimmune thyroid disease, IBS, Dermatitis herpetiformis, Selective IgA deficiency
    - Absence of *DQ2* and *DQ8* render CD highly unlikely
  - Equivocal biopsy

# Treatment of celiac disease

78

- Gluten-free diet (GFD)

# Foods containing gluten

79

# Gluten-free foods

80

# Monitoring adherence to treatment

81

- Monitoring adherence to gluten-free diet (GFD) or disease activity is part of American Gastroenterological Association (AGA) guidelines
  - tTG and/or DGP IgA and IgG assays
    - Typically ordered every 3-6 months
    - If high for >12 months consider rebiopsy
  - F-actin IgA antibody
    - Declining levels of F-actin IgA

82

# Cases and questions

# 22 yo F with weakness and fatigue when exercising

83

- Upon further questioning
  - ▣ Tingling and numbness in her fingers
  - ▣ Itchy rash
  - ▣ Diarrhea for past 2 years with associated abdominal pain
  
- ▣ Serology was done
  - IgA WNL
    - DGP IgA high
    - tTG IgA high
  - HLA typing
    - DQ2 positive

Diagnosis: Celiac disease

What is the treatment?

Gluten free diet

# Conclusion

84

- Gluten free diet is treatment of celiac disease

# 60 yo M w/ diarrhea

85

- Upon questioning
  - ▣ Diarrhea started yesterday after he ingested a very old potato salad
  - ▣ On exam scaly rash was observed (upon questioning he first noticed the rash 10 years)

Should tTG and DGP be done in this case?

No

This patient has probably psoriasis and ingested potato salad with *Staph aureus* toxin.

# Conclusion

86

- Chronic diarrhea is a symptom of celiac disease

# 31 yo M with allergies, weakness and diarrhea

87

- Diarrhea for past 3 years
- Patient has been losing weight for past 2 years
- IgA screen was performed
  - ▣ IgA - not detected
- What immunoglobulin should be tested in this patient?
  - ▣ DGP and tTG IgG
- Results came back negative, what now?
  - ▣ HLA testing/biopsy
  - ▣ Patient is HLA DQ2 and DQ8 positive
  - ▣ Biopsy showed short villi

Celiac disease was diagnosed

# Conclusions

88

- If patient has selective IgA immunodeficiency, use IgG in serologic tests
- HLA DQ2 and DQ8 predispose for CD
- Patient with CD will show short villi on biopsy

# Which of the following foods contains gluten?

89

- A. Orange juice
- B. Honey
- C. Whiskey
- D. Seaweed
- E. None of the above

Whiskey is a type of distilled alcoholic beverage made from fermented grain mash.
