

# **Advising Clinicians on Laboratory Test Selection and Results Interpretation with a Diagnostic Management Team**

**Michael Laposata, MD, PhD**

**Edward and Nancy Fody**

**Professor of Pathology**

**Vanderbilt University School of Medicine**

**Pathologist in Chief, Vanderbilt University Hospital**

# Outline of the Presentation

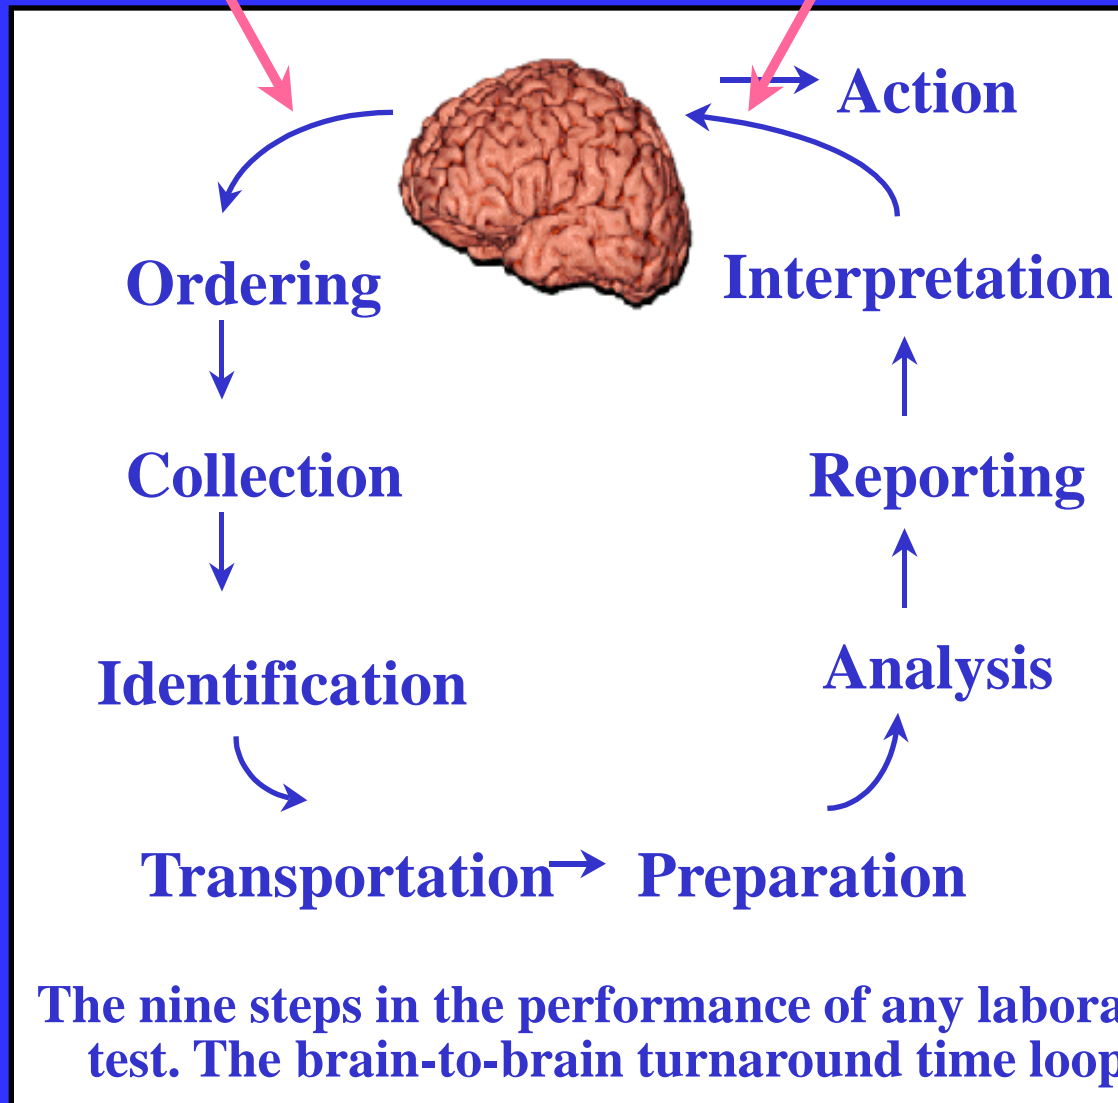

- 1. Presentation of the Clinical Problem**
- 2. The Diagnostic Management Team at Vanderbilt :  
What it does and how it was created**
- 3. The Existing and Planned Diagnostic Management  
Teams at Vanderbilt**
- 4. Coagulation Rounds : An example of the DMT in action**
- 5. Concluding Thoughts**

# Outline of the Presentation

1. **Presentation of the Clinical Problem**
2. **The Diagnostic Management Team at Vanderbilt :  
What it does and how it was created**
3. **The Existing and Planned Diagnostic Management  
Teams at Vanderbilt**
4. **Coagulation Rounds : An example of the DMT in action**
5. **Concluding Thoughts**

**Has the right test  
been ordered?**

**Error between result  
receipt and action?**

**Lundberg , 1981**

## **Survey of US Medical Schools**

**Brian Smith MD, PhD and the CLIHC group at the CDC – Preliminary Data from the Survey**

**Number of hours spent by medical students learning anatomic pathology : 60 – 300 is the range**

**Mean number of hours spent by medical students learning laboratory medicine : 9**

**And there is most often no test for the laboratory medicine coursework, and the teaching is often done by individuals with no laboratory medicine training**

# The Use of Pathology Services in Practice

**Number of hours spent by clinicians doing anatomic pathology : None – it is done by anatomic pathologists**

**This is what is taught in medical school**

**Frequency with which a clinician orders and interprets laboratory tests : Daily**

**This is what is barely taught in medical school**

**2012**

***How challenging is it for the clinician to establish a diagnosis quickly and accurately?***

**Radiology: Dozens of imaging modalities**

**Lab Medicine: Test Menu > 2000 Assays without the impending thousands of genetic tests**

**Anatomic Pathology: Autopsy / Biopsy / Surgical Pathology / Cytopathology**

***Why not have all the diagnostic specialists convene and synthesize their findings and establish a diagnosis for the clinician – especially in complex cases?***

# Consequences of the Vast Array of Testing Options

Doctors pick unnecessary tests or miss the necessary ones

Dozens of approaches emerge for diagnosis of the same condition – some better than others

The correct diagnosis may be achievable promptly, but it is missed or very commonly delayed, with adverse clinical consequences to the patient and/or adverse financial consequences to the institution

**The landscape is changing rapidly**

**Is the interpretation for coagulation testing rarely needed ?**

**How many patients have coronary artery disease and have a stent placed?**

**Many thousands in the US!**

**Plavix keeps the stent open and the patient alive –**

**Is lab testing important?**

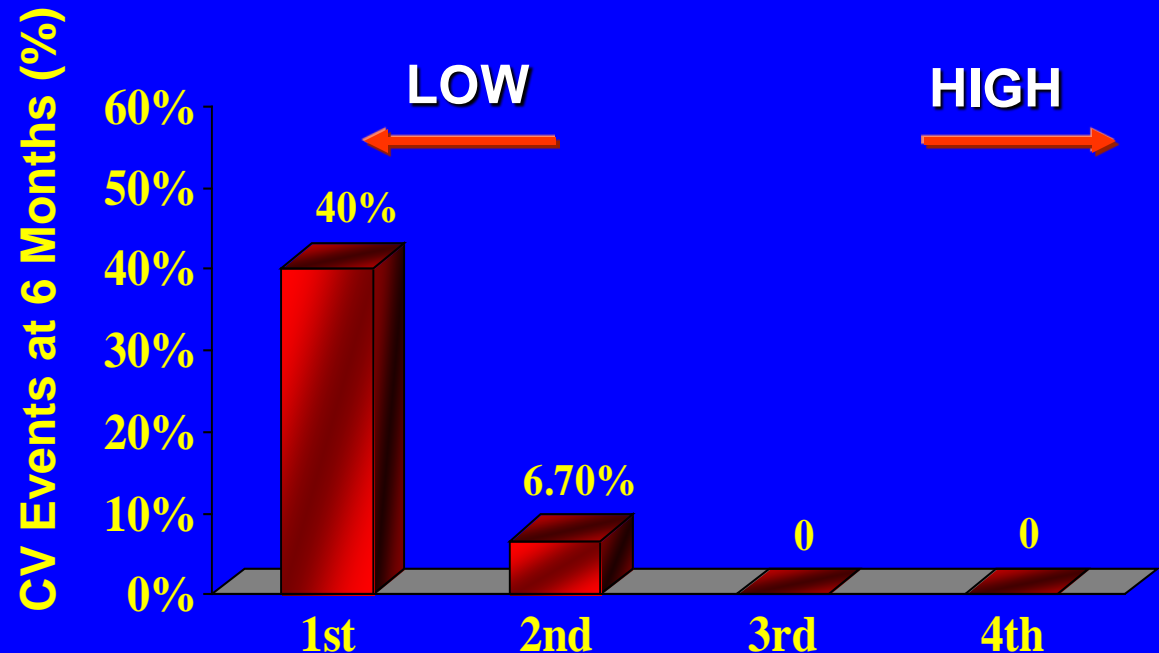

**Are the results complex?**

# EFFECTIVENESS OF CHRONIC PLAVIX THERAPY

## Response to Plavix

Clopidogrel nonresponsiveness is associated with increased risk of thrombotic events and correlates to poorer clinical outcomes

## % Patients with Recurrent CVS Events at 6 Months

*Matetzky et al. Circulation 2004; 109:3171-3175*

## INDIVIDUAL RESPONSE TO PLAVIX IS VARIABLE

- Patients exhibit variable response to clopidogrel
- Patients may also experience variable return of platelet function after clopidogrel is withdrawn prior to surgery

*Serebruan et al. J Am Coll Cardiol 2005;45:246-51*  
*Hochholzer et al. Circulation 2005; 111:2560-4*

# INHIBITION OF PLATELETS BY CLOPIDIGREL: INHIBITION AT THE ADP RECEPTOR

## **Genetic Studies**

**for Cyp2C19 loss of function  
alleles in the liver –**

**that convert Plavix to its active metabolite –  
can identify patients who do not have an  
anti-platelet effect from Plavix**

**N Engl J Med 360: 363, 2009**

**Following the Warfarin Experience,  
Pharmacogenomics for Plavix is Introduced to a  
Skeptical Audience of Potential Users and  
Laboratory Directors**

**For patients being treated with Plavix, there is a  
an opportunity to reduce the risk for thrombosis  
by performing pharmacogenomics testing to  
determine if Plavix is likely to be effective**

**and**

**the change to a more effective antiplatelet agent  
can be performed at no extra cost**

## Who is Being Tested for CYP2C19 at Vanderbilt ?

All patients who are receiving a coronary artery stent by interventional cardiology

**and now in addition**

Patients seen in primary care who are expected to require a coronary artery stent – and will need Plavix after it is placed – so that the appropriate antiplatelet drug is selected in advance

Patients chosen for this testing qualify by a complex formula based upon clinical and laboratory findings

# Many Alleles for CYP 2C19 – Plavix metabolism May Be Difficult to Assess

<u>Allele Name</u>	<u>Comments</u>
CYP 2C19*1	Wild-type/normal
CYP 2C19*2	nonfunctional
CYP 2C19*2B	nonfunctional
CYP 2C19*3	poor metabolism of compounds like proguanil - with implications for malaria prophylaxis
CYP 2C19*4	nonfunctional
CYP 2C19*5	poor metabolizer
CYP 2C19*6	nonfunctional
CYP 2C19*7	nonfunctional
CYP 2C19*8	nonfunctional
CYP 2C19*17	ultra-rapid metabolizer

# Clonidogrel \*2/\*2 Decision Support

HEO Popup

## Clonidogrel Poor Metabolizer Rules

**Genetic testing has been performed and indicates this patient may be at risk for inadequate anti-platelet response to clonidogrel (Plavix) therapy**

This patient has been tested for CYP2C19 variants, and the presence of the \*2/\*2 genotype has identified this patient as a **poor metabolizer** of clonidogrel. Poor metabolizers treated with clonidogrel at normal doses exhibit higher rates of stent thrombosis/other cardiovascular events.

**Treatment modification is recommended if not contraindicated:**

- Prescribe prasugrel (EFFIENT) 10mg daily and stop clonidogrel (PLAVIX) startdate, 10 AM

**Due to increased risk of bleeding compared to clonidogrel, prasugrel should not be given to patients:**

- that have a history of stroke or transient ischemic attack **\*\*\* Not known; please check StarPanel**
- that are greater than 75 years of age
- whose body weight is less than 60 kg

Click here for [more information](#)

**Ticagrelor-new alternative to be added soon.**

**If prasugrel (EFFIENT) not selected, please choose desired action:**

- Increase maintenance dose of clonidogrel (PLAVIX) 150 mg daily, startdate, 10AM
- Maintain requested daily dose of clonidogrel (PLAVIX) 75 mg daily, startdate, 10AM

**If not using prasugrel, please select a reason:**

- Contraindicated for prasugrel
- Potential side effects
- Patient opts for clonidogrel
- Other (Specify)

Click here for [more information](#)

Cancel

Order

**NOTE:** The Vanderbilt P&T Committee has recommended that prasugrel (if not contraindicated) should replace clonidogrel for poor metabolizers; if this is not possible consider doubling the standard dose of clonidogrel (or, use standard dose clonidogrel). However, there is not a national consensus on drug/dose guidance in this population.

Close

**Even with this level of  
automatic decision support,**

**Doctors still want the test  
results interpreted by an  
expert in clinical context**

**We learned more than 10 years ago  
that practicing physicians greatly  
benefit from**

**patient specific, expert driven, and  
timely**

**interpretations of coagulation tests**

**2000 Survey of MGH physician experience with narrative interpretations of complex laboratory evaluations in coagulation**

**Ordering physicians electronically sent a narrative interpretation of one their own cases**

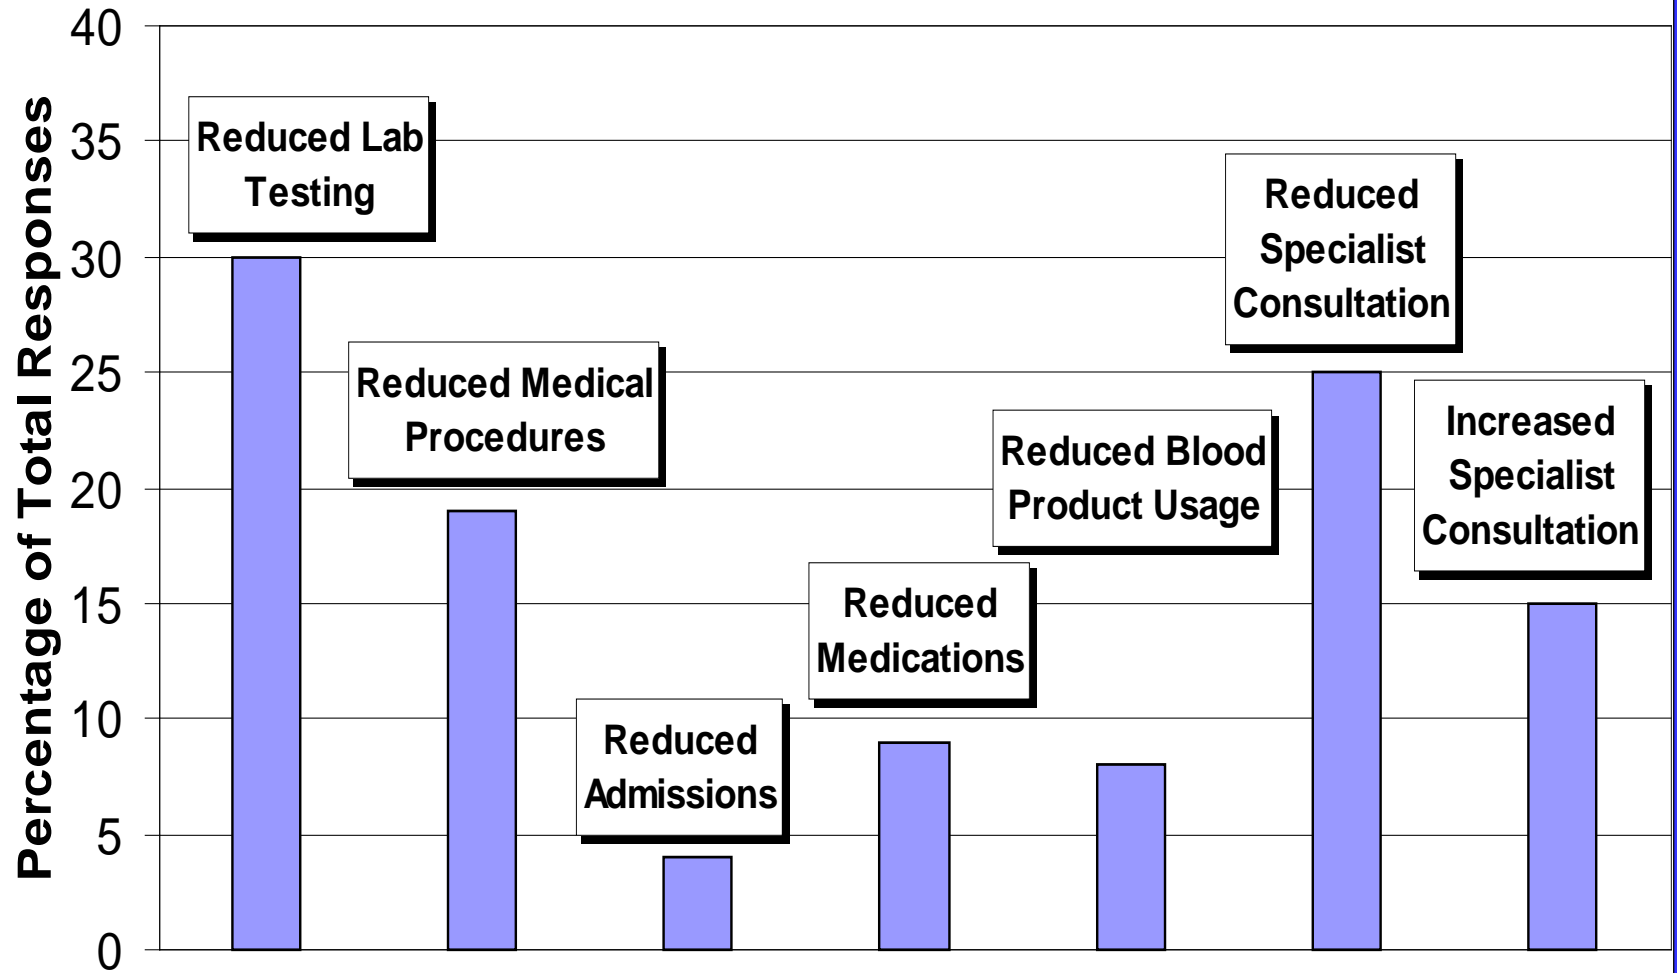

**Clinicians asked to respond electronically to several questions about the interpretation**

**100 of 100 surveys returned**

## Interpretation Impact - Physician Outcomes

# Interpretation Impact Medical Utilization

# **Comments from Physicians in a Behind the Glass Survey about Use of the Clinical Laboratory : A CLIBC Project**

**“You don’t talk to a Radiologist or Pharmacist in a hospital, you talk to a colleague. You talk to a lab, it’s a black box...”**

**“I don’t think about say calling the clinical pathologist. They have not made themselves available to help me; I don’t know who they are”**

**“Getting through the maze on the telephone [with the laboratory] is difficult.”**

**So clinicians across the US  
are asking why pathologists  
aren't helping them select  
tests and interpret test  
results?**

**What is the answer?**

# Outline of the Presentation

1. Presentation of the Clinical Problem
2. The Diagnostic Management Team at Vanderbilt :  
What it does and how it was created
3. The Existing and Planned Diagnostic Management  
Teams at Vanderbilt
4. Coagulation Rounds : An example of the DMT in action
5. Concluding Thoughts

# **The Diagnostic Management Team at Vanderbilt :**

**What it does**

**How it was created**

**What does a diagnostic  
management team do**

**and**

**what is not a diagnostic  
management team activity ?**

**It is not a diagnostic management team activity if any of the following are true**

- The interpretation does not consider clinical information**
- The service does not meet on a regular schedule**
- The interpretation is not written or not included in the medical record**
- The interpretation is so self evident that it is not clinically valuable for the treating physician**

**For example : The interpretation only provides a report of tests results as abnormal but fails to explain why**

# **Barriers to Diagnostic Management Team Creation**

**And how they have been  
overcome at Vanderbilt**

# Why Are National Barriers Not Barriers At Vanderbilt?

**Failure of institutions to recognize the clinical and financial benefits of advice on test selection and result interpretations on the total patient encounter.**

***Anatomic pathology interpretation* : Professional fee pays \$300**

***Clinical laboratory interpretation* : Professional fee is \$0 and the savings from a more rapid and more accurate diagnosis is \$3000**

**Almost no one understands  
this in 2012**

# Why Are National Barriers Not Barriers At Vanderbilt?

**The initial development of informatics that assists in the creation of the interpretations requires substantial expertise and resources from informatics, which is in most institutions inadequate.**

*Vanderbilt is a national leader in medical informatics, and informaticians are heavily invested in the development of enablers for this clinical service*

**If it takes too long to sign out a case, a DMT is impossible.**

**An informatics solution to efficiently and carefully review relevant clinical and lab data is absolutely necessary.**

# Why Are National Barriers Not Barriers At Vanderbilt?

**Too few classically trained experts in laboratory medicine are to provide clinically useful advice.**

*Vanderbilt has made certain that there is a large group of local experts in laboratory medicine –*

*The main criterion for hiring a lab director is NOT the degree (MD, PhD, DCLS?) – it is the ability to increase the speed and accuracy of diagnosis – the professional fee for the interpretation is irrelevant to the DMT concept*

**If payment for the consult is less relevant than the savings from a quick and accurate diagnosis,**

**all qualified individuals should be invited to help establish the correct diagnosis**

# Why Are National Barriers Not Barriers At Vanderbilt?

**The difficulty in quantifying financial benefit for advice of test selection and result interpretation, with underestimation of benefit.**

*Vanderbilt has involved health economists to determine the financial and clinical benefit of the diagnostic management team output*

**No one was asked to prove that a microscopic interpretation of a biopsy for cancer makes a clinical difference before the service was started -**

**and no one asked was asked to prove that an MRI is valuable before it became widely available**

**And in both of these cases, expensive tests were added but the outcomes for patients improved**

**SO - Why do even pathologists ask whether interpretation of test results for the most complex areas of lab medicine is needed?**

**Because pathologists do not get paid for this activity and most do not have the content knowledge to be effective in advising fellow doctors about clinical laboratory test selection and result interpretation**

# Outline of the Presentation

From Dr. Adam Seegmiller

# Reflex Testing in Hematopathology

- At the time of bone marrow biopsy, the oncologist orders “bone marrow testing panel”
- **Pathologist:**
  - **Consults electronic medical record and patient flowsheet for history and previous test results**
  - **Reviews bone marrow morphology**
  - **Orders appropriate cytogenetic and molecular tests**
- The oncologist retains the option to order tests “a la carte”

# Significant Savings with Reflex Testing in Hematopathology

- Cost per marrow is \$284 less for reflex testing.
- Yearly savings (>1800 bone marrows) exceeds \$450K.

# Microbiology Rounds

Multiple Attendings

Microbiology Laboratories  
(Including Virology and  
Molecular Infectious Disease)

Expert Driven,  
Patient Specific Interpretations  
(With Regular Follow Up by DMT)  
For Clinically or  
Diagnostically Complex Cases –  
Define Ad Hoc Now and  
Formally With Increased Experience

All Clinical Services Evaluating  
Patients for Infectious Disease –  
With Infectious Disease  
Division as Prominent User

Financial Benefits:  
Improved Use of Antibiotics  
Could be Quantified

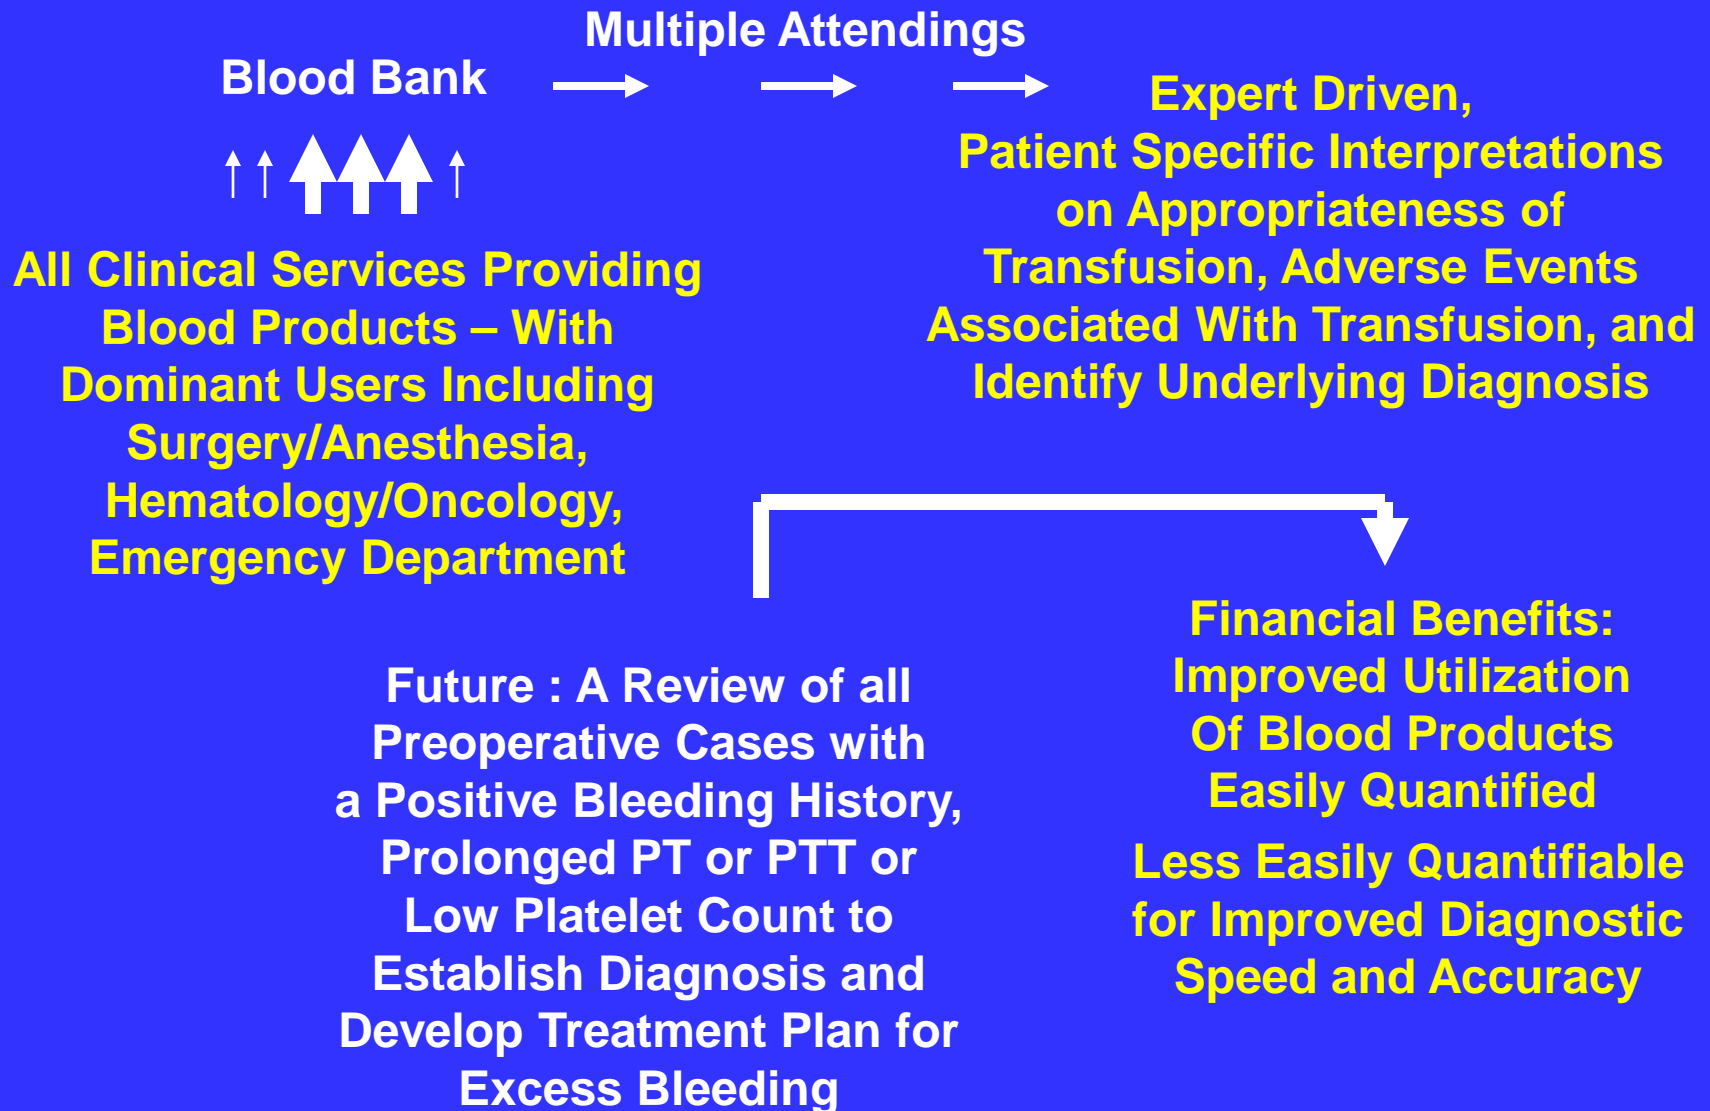

Less Easily Quantifiable  
for Improved Diagnostic  
Speed and Accuracy

# Interpretations by the Microbiology Diagnostic Management Team

- Clinically significant combinations of pathogen and site of detection
- **Unusually virulent pathogen or strain**
- MDR antimicrobial susceptibility pattern
- **Unexpected antimicrobial susceptibility or resistance**
- Findings suggestive of treatment failure
- **Infection control or public health issues**
- Findings suggestive of underlying pathology
- **Concern for rapid disease progression**
- Conflicting, confusing, or ambiguous results
- **Any result that a technologist considers atypical or concerning with respect to patient well-being**

# Transfusion Medicine Rounds

# **Transfusion Medicine Rounds**

## **The Predominant Case Material**

**The expert driven consult is provided as a note in the chart for the majority of these cases**

**It is NOT a curbside consult**

# **Transfusion Medicine Rounds – Predominant Case Material**

## **Transfusion Reactions**

**What are the results from the tests performed in the evaluation of a transfusion reaction ?**

**What is necessary going forward to effectively transfuse the patient who experienced the transfusion reaction?**

# **Transfusion Medicine Rounds – Predominant Case Material**

## **RBC Antibody Identifications**

**What are the results from the cell panel that resulted in the identification of a specific red blood cell antibody ?**

**What is the availability of blood products for this patient, given the presence of the newly identified antibody ?**

# **Transfusion Medicine Rounds – Predominant Case Material**

## **Massive Transfusion Protocol Review**

**What was the clinical indication for the massive transfusion protocol?**

**How many products were utilized in the massive transfusion protocol?**

**Were any of the products in the cooler for the massive transfusion wasted?**

# **Transfusion Medicine Rounds – Predominant Case Material**

**Case discussions about patients receiving out of group platelet transfusions to determine the need for Rh Immune globulin**

**If an Rh negative patient has received an Rh positive product, should Rh immune globulin be transfused to prevent the development of an antibody to the Rh antigen?**

# **Transfusion Medicine Rounds – Predominant Case Material**

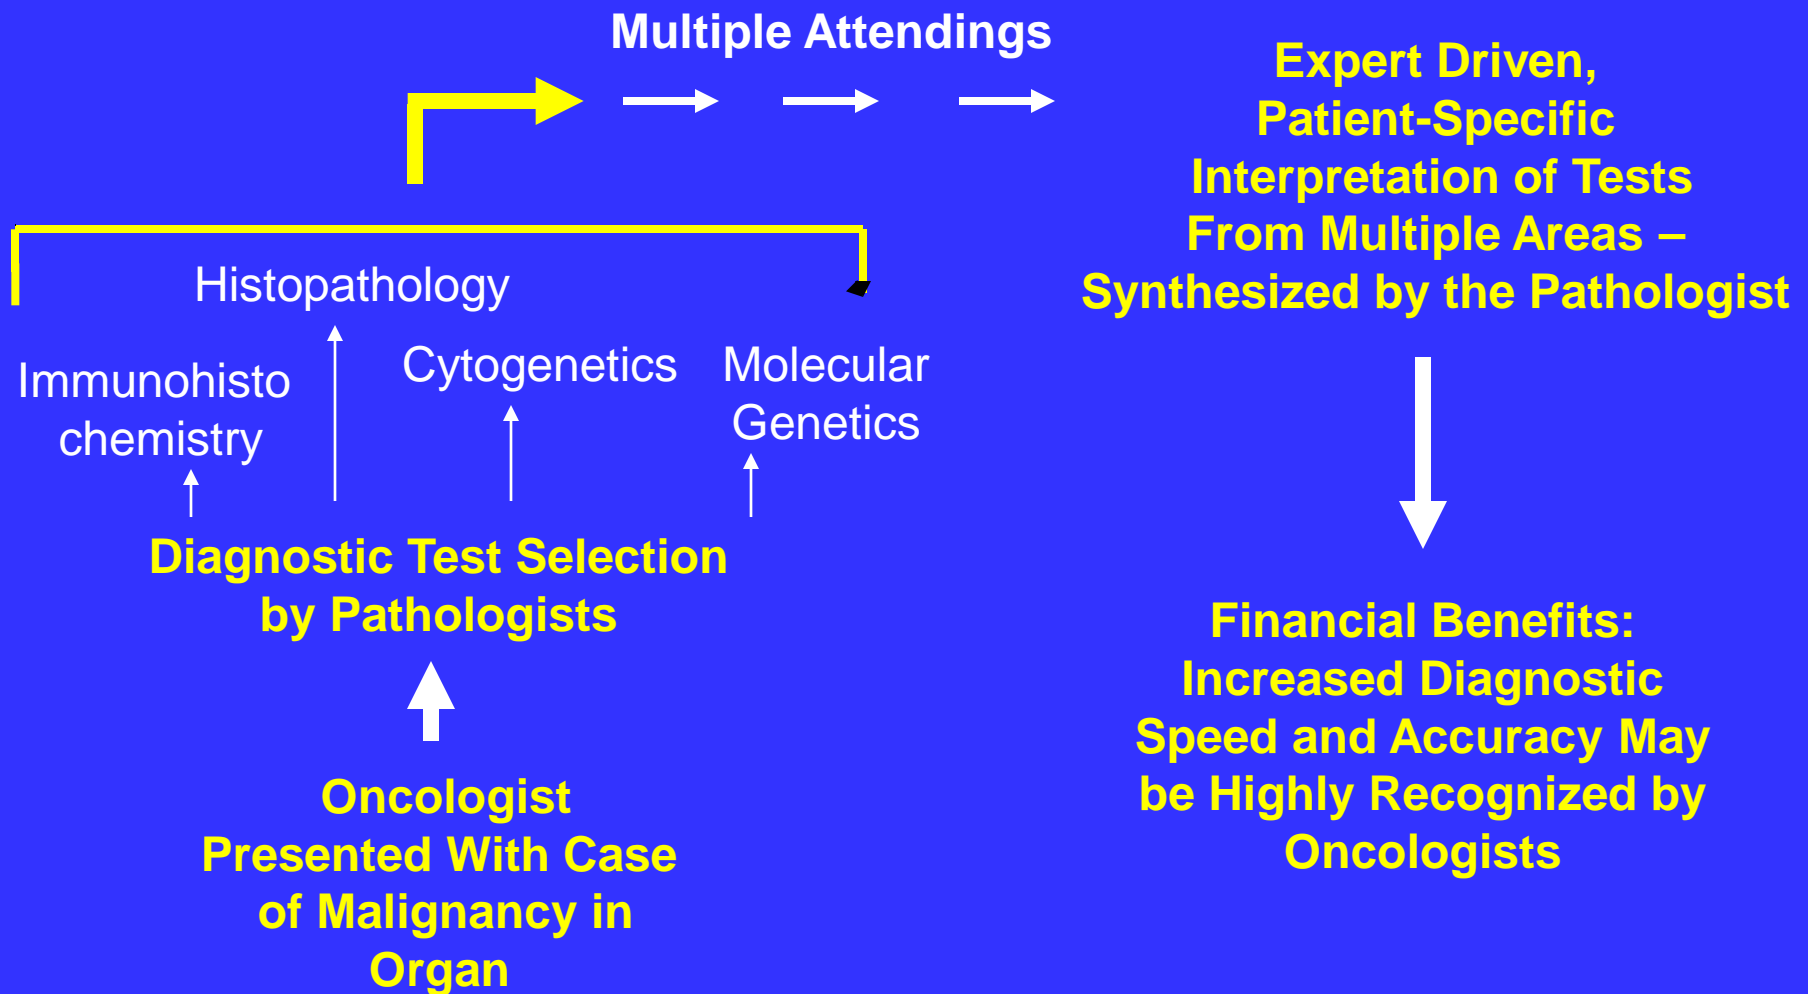

**Real time review of errors related to cases with transfusions**

**If an error was associated with a test performed in the transfusion medicine laboratory or in association with the transfusion, what was the cause of the error?**

**What systems can be implemented to prevent the recurrence of this error?**

Anticoagulant Confirmed DMX:  
1.3 F11Act: 96 F12Act: 54**

# It evolved to this “canned” comment – Is this helpful ?

## Unedited “canned” comment

The Dilute Russell Viper Venom time (dRVVT) is used for detection of Lupus Anticoagulant. Hemolysis, deficiencies or inhibitor of Factors II, V and X, high Factor VIII level (>200%), Heparin level >1 IU/ml, some LMWH, Coumadin and other Vitamin K antagonists may interfere with test results. In order to determine etiology of prolonged dRVVT, a mixing study was performed showing no dRVVT correction, indicating the presence of Lupus Anticoagulant.

**NEVER AT VANDERBILT UNIVERSITY**

**Report in the medical record after initiation of the daily rounds to interpret all complex evaluations from the special coagulation laboratory**

**JULY 1, 2010 VANDERBILT UNIVERSITY**

This patient has an elevated PTT, with a normal PT/INR and normal thrombin time.

A PTT mixing study failed to correct into the normal range. These results were consistent with the presence of an inhibitor (such as a lupus anticoagulant) in the sample.

The Dilute Russell Viper Venom time (dRVVT) is used for detection of Lupus Anticoagulant, and the test was positive, indicating the presence of Lupus Anticoagulant.

**Taken together, this is a patient with a prolonged PTT based upon the presence of a lupus anticoagulant.**

# Attendees at the Coagulation DMT and their responsibility

- The trainee(s) – usually a pathology resident and occasionally a hematology-oncology fellow or a medical student under the guidance of a resident or fellow

Reviews the medical record for each case to collect information relevant to coagulation issues

And provide a draft patient specific interpretation of the laboratory test results in clinical context

# Attendees at the Coagulation DMT and their responsibility

- **The attending laboratory director**

Reviews presented cases and interpretations drafted by the trainee,

For immediate inclusion into the medical record when finalized at rounds

# Attendees at the Coagulation DMT and their responsibility

- **The Medical Technologist**

Provides input on interpretation of test results when there is a relevant question such as :

**Result is influenced by the methodology**

**Sample was partially compromised**

**Attendees require education about assay**

**A series of suspicious results suggest the possibility of a laboratory error**

# Role of the Information Scientist in the DMTs

- **Information scientist is in attendance 2 times per week at the coagulation DMT**
- **The activity is to provide patient-centered, expert-driven, evidence-based medicine literature support to the DMTs when relevant clinical questions arise**
- **DMT database tool contains the answers to questions posed at the DMT rounds and is constructed for reuse and distribution of information to others**

*Provided by Tracy Shields*

Search or  
browse  
for a topic

Two ways to ask clinical  
questions or suggest  
topics:

- 1) through the electronic  
medical record, and
- 2) through the DMT tool

Selected  
list of  
library  
resources

The screenshot shows a web interface for a clinical database. At the top, there are four buttons: "Search the Database", "Submit a Question", "Most Used Resources", and "Disclaimer". Below these is a "Topic Database Search" section with a search input field and a "Search" button. Underneath are three tabs: "Browse Topics", "Browse by DMT" (which is selected), and "Browse by Category". Below the tabs is a navigation bar with letters A through Z and 0-9, followed by a "(View All)" link. The main content area displays a list of topics under the heading "Displaying titles 1 - 55 of 55 for DMT - Coagulation Diagnostic Management Team". The topics listed are: "Acetaminophen and Platelet Function" (1 evidence packet), "Antiphospholipid Antibodies" (3 evidence packets), "Antiphospholipid Antibody Syndrome" (3 evidence packets), "Antiplatelet Therapy" (1 evidence packet), "Aspirin Resistance", "Bernard-Soulier Disease", "Child Abuse Misdiagnosis", "Coagulation Factor Tests and Pediatric Reference Values", "Coagulopathies by Population" (1 evidence packet), and "Cryofibrinogenemia".

## Superficial Venous Thrombosis (Coag DMT)

### I. Superficial Thrombophlebitis, Lower Extremities Overview - Expert Searches

 **UpToDate**<sup>®</sup> (Database) ([Search Database](#))

Completed Question

- **What is recommended in the literature for treatment of superficial venous thrombosis?** (Apr. 2011)

#### Summary

[Download PDF for Full Summary and References](#)

Guidelines from a chapter of the American College of Chest Physicians Evidence-Based Clinical Practice Guidelines (8<sup>th</sup> Edition) include the following recommendations for the treatment of superficial vein thrombosis ([Kearon et al. 2008](#)):

"For patients with spontaneous superficial vein thrombosis, we suggest prophylactic or intermediate doses of LMWH [low molecular weight heparin – ed.] (Grade 2B) or intermediate doses of UFH [unfractionated heparin – ed.] (Grade 2B) for at least 4 weeks. We suggest that as an alternative to 4 weeks of LMWH or UFH, VKA [vitamin K antagonist – ed.] (target INR, 2.5; range, 2.0 to 3.0) can be overlapped with 5 days of UFH and LMWH and continued for 4 weeks (Grade 2C). We suggest that oral NSAIDs should not be used in addition to anticoagulation (Grade 2B). We recommend medical treatment with anticoagulants over surgical treatment (Grade 1B).

Remark: It is likely that less extensive superficial vein thrombosis (ie, where the affected venous segment is short in length or further from the saphenofemoral junction) does not require treatment with anticoagulants. It is reasonable to use oral or topical NSAIDs for symptom control in such cases."

These guidelines cite numerous other studies and a Cochrane review of treatment of superficial thrombophlebitis ([Di Nisio et al. 2007](#)). Other authors ([Carnero-Vidal et al. 2010](#); [Kitchens 2011](#)) note other existing factors such as site and concurrent deep vein thrombosis for consideration with regard to treatment selection. Kitchens (2011) notes that "I treat the majority of patients with a clinical diagnosis of SVT [superficial venous thrombosis – ed.] on an equal footing as patients with other VTE [venous thromboembolism– ed]."

A randomized, placebo-controlled, double-blind trial (Comparison of Arixtra in Lower Limb Superficial Vein Thrombosis with Placebo [CALISTO]) published in 2010 compared fondaparinux to placebo in patients with acute, symptomatic lower-limb superficial vein thrombosis 5 cm or greater in length ([Decousus et al. 2010](#)). Treatment with fondaparinux (2.5 mg once daily) or placebo was administered for 45 days, and patients were followed for 30 days after discontinuing treatment. Incidence of symptomatic pulmonary emboli, deep vein thromboses,

# **The Clinical Impact is Greatly Beneficial to Patients**

**A one minute overview of case  
material in the coagulation DMT**

**For the patient with a prolonged PT, PTT or  
both –**

**What is the explanation for the prolongation  
and what is the risk of bleeding or thrombosis?**

# Coagulation Rounds – Predominant Case Material

What is the likelihood of –

**Heparin-induced thrombocytopenia (HIT)?**

**Thrombotic thrombocytopenic purpura (TTP)?**

**Both are life-threatening conditions if not identified promptly and treated correctly**

# **Coagulation Rounds – Predominant Case Material**

**For the adult or pediatric patient with a deep vein thrombosis and or pulmonary embolism –**

**Is a hypercoagulable state contributory to the thrombotic event?**

**Do the test results suggest the need for lifelong anticoagulation?**

# Coagulation Rounds – Predominant Case Material

For the bleeding patient –

**Does the patient have von Willebrand disease?**

**A platelet function disorder?**

**A coagulation factor deficiency and if so,  
what is the cause of the deficiency?**

**DIC?**

# Coagulation Rounds – Predominant Case Material

For thrombotic strokes –

**Is there a hypercoagulable state**

**contributing to the cause(s) for stroke?**

**Is aspirin therapy enough or is warfarin needed?**

# **Coagulation Rounds – Predominant Case Material**

## **Obstetrics & Gynecology**

**For the woman with pregnancy losses –**

**Is there a hypercoagulable state to explain  
the fetal loss(es)**

# Coagulation Rounds – Predominant Case Material

For pre- renal transplant evaluation –

**Is there a hypercoagulable state that would  
cause us to remove this patient from the  
transplant list?**

# Coagulation Rounds – Predominant Case Material

For the adult or pediatric patient with autoimmune disease –

**Is there an antiphospholipid antibody that presents an increased thrombotic risk in this patient?**

# Coagulation Rounds – Predominant Case Material

For Pediatrics

**In the bruised child – is there any evidence of a bleeding disorder to account for the bruising or is child abuse more likely?**

# How Can the Savings from Diagnostic Management Team Activity be Quantitated?

**Better Diagnostic Test Selection**

**EASILY QUANTITATED SAVINGS**

**Improved Patient Outcomes**

**DIFFICULT TO QUANTITATE**

# Analytic Approach

## Interrupted Time Series

**Examine differences in total charges and Length of Stay, pre / post implementation of DMT pilot**

**Test for statistically significant differences in total charges and length of stay in both parametric (t-tests) as well as non-parametric (Wilcoxon signed rank tests) due to the small sample sizes and non normal underlying distributions.**

# Changes in Length of Stay

## Parametric Test of Mean Differences by MS DRG grouping CY 2010

MS DRG	Cases	MS DRG Description	Length of Stay		% Change	
			Before	After		
			Jan - July	Aug - Nov		
			Mean LOS			
175-176	101	PE w & w/o MCC	3.83	2.87	-25.1%	**
64-66	368	Intracranial Hemorrhage	5.49	5.47	-0.4%	ns
	49719	All inpatients	5.3	4.82	-9.1%	***

## Non-Parametric Test of Median Differences by MS DRG grouping CY 2010

MS DRG	Cases	MS DRG Description	Length of Stay		% Change	
			Before	After		
			Jan - July	Aug - Nov		
			Median LOS			
175-176	101	PE w & w/o MCC	3	2	-33.3%	**
64-66	368	Intracranial Hemorrhage	4	3	-25.0%	*
	49719	All inpatients	3	3	0.0%	ns

# “Diagnostic Latency” - I

- Tests ordered when patient admitted on Monday.
- **Results back Tuesday with several abnormal results.**
- Action taken on Wednesday with further evaluation.

# **“Diagnostic Latency” - II**

- **Diagnosis and discharge plan on Thursday. Patient gone by 3 PM.**

**Length of Stay: 4 days**

# No Diagnostic Latency - I

- **Tests ordered when patient admitted on Monday.**
- **Results to coagulation rounds with preliminary interpretation by coagulation resident Monday at 4:00 p.m.**
- **Patient specific, expert driven narrative completed by 6:00 p.m. Monday and into medical record.**

# No Diagnostic Latency - II

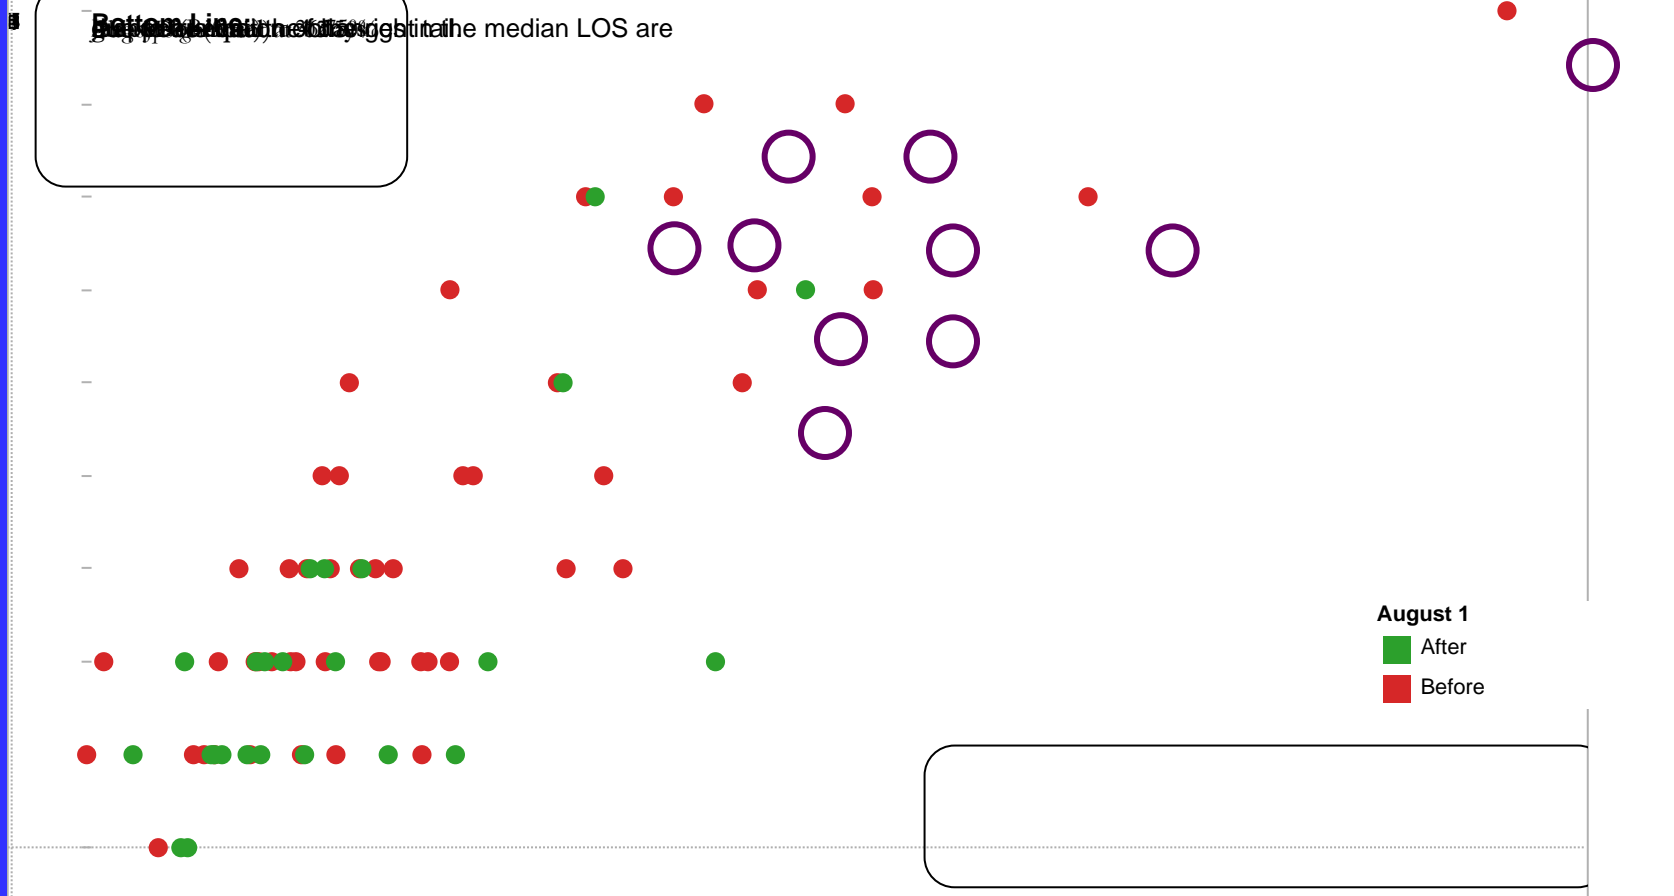

- Further evaluation Tuesday.
- Discharge on Wednesday.

Length of Stay: 3 days

**Limiting factor for some evaluations: Not all assays done daily Monday-Friday, delaying narrative and increasing length of stay.**

# MSDRG 176: PE

Percent of Cases with LOS Comparison of Length of Stay and Total Charges Pre and Post Aug 1, 2010

# MSDRG 65 Intracranial Hemorrhage

Comparison of Length of Stay and Total Charges Pre and Post Aug 1, 2010

# Conclusion

- **There is evidence that in coagulation sensitive DRGs an initiative is related to an observed change in LOS.**

**This change was largely attributable to reducing long LOS outliers**

# If There Truly Is a Decrease in Length of Stay for Coagulation Related DRG's, Is It Because...

- Diagnostic latency is decreased?
- A dialogue between diagnostic and therapeutic doctors has been created?
- Expert diagnostic doctor increases visibility with increased continuing medical education of doctors in medical center?

# **If There Truly is a Decrease in Length of Stay for Coagulation Related DRG's, Is It Because...**

- As treating doctors read dozens of coagulation interpretations their knowledge base on the significance of the test results grows continuously?**

# Outline of the Presentation

1. Presentation of the Clinical Problem
2. The Diagnostic Management Team at Vanderbilt :  
What it does and how it was created
3. The Existing and Planned Diagnostic Management  
Teams at Vanderbilt
4. Coagulation Rounds : An example of the DMT in action
5. Concluding Thoughts

**Are pathologists in practice willing to provide advice on test consultation and result interpretation ?**

**If you make a handsome salary doing AP**

**If you have to learn a lot of new material –**

**Including genetic testing**

**Even in the presence of threats to the classical practice of mostly anatomic pathology in community hospitals -**

**because the threats have been present for some time**

# **What are the signs that the change in pathology practice is really going to happen shortly ?**

- The CAP has a strategy committee to discuss the issue and is putting member dues at risk for providing information that is not welcoming to most members**
- Digital imaging in anatomic pathology is getting better**
- There is a lot less money for healthcare from the government to hospitals**
- Genetic testing at >\$5000 per test is making pathology at least as expensive as radiology**

**If it is really the lack of reimbursement for advice  
on laboratory test selection and result  
interpretation -**

**Maybe nothing will happen until community  
hospital pathologists can no longer earn a living  
doing only anatomic pathology**

**A major learning curve among pathologists will  
be necessary, similar to what happened when  
hematology merged with oncology and  
hematologists had to learn how to manage  
cancer patients almost overnight**
