New Classifications for Cytology: The Milan System for Salivary Gland (One Year In)

Jeffrey F. Krane, MD PhD
Professor of Pathology, David Geffen School of Medicine at UCLA

David Geffen School of Medicine

UCLA Health

Objectives

- Review the bases for the Milan classification system
- Identify the morphological criteria and pitfalls for various benign and neoplastic entities
- Demonstrate the role of ancillary immunocytochemical and molecular tests in lesions of these sites
- Recognize the management options of lesions in these sites

The Benefits of a Uniform Reporting System for Salivary Gland Cytopathology

- Improve communication
  - Between pathologists, clinicians and patients
- Improve patient care
  - Help standardize ROM and clinical management
- Facilitate cytologic-histologic correlation
- Facilitate research and sharing of data from different laboratories for collaborative studies

The Milan System for Reporting Salivary Gland Cytopathology

Assembled in 2015

Sponsored by the ASC and the IAC

Goal to produce a practical, user-friendly and internationally accepted classification system

Evidence-based

Anticipated that the classification system and ROM for the diagnostic categories will be further refined as more data is available in the literature

The Milan System for Reporting Salivary Gland Cytopathology

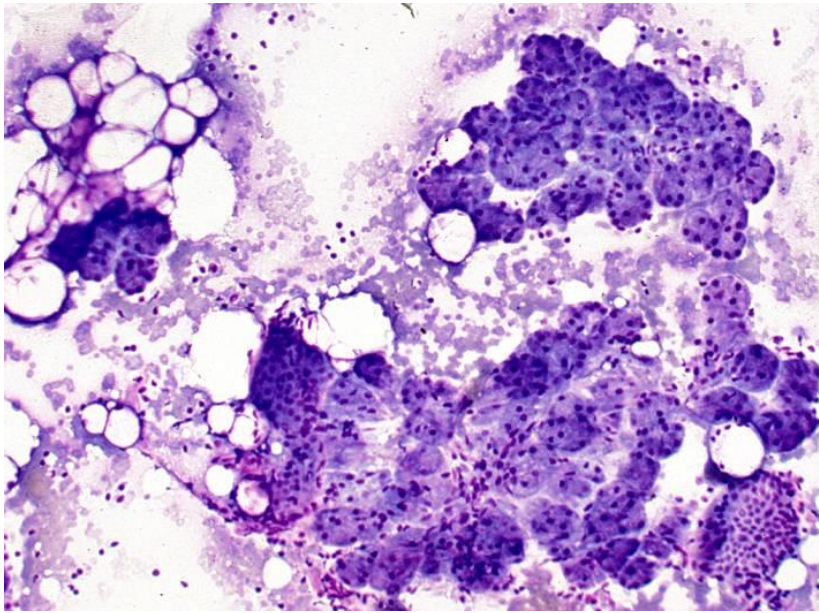
Classification Scheme

1) Non-Diagnostic
2) Non-Neoplastic
3) Atypia of Undetermined Significance (AUS)
4) Neoplasm:
    a) Benign
    b) Salivary Gland Neoplasm of Uncertain Malignant Potential (SUMP)
5) Suspicious for Malignancy
6) Malignant

Non-Diagnostic

- "…for qualitative and/or quantitative reasons provides insufficient diagnostic material to provide an informative interpretation"
- Poorly preserved slides with artifacts that preclude evaluation
- Includes aspirates with benign elements only, in the setting of a defined mass
- Includes non-mucinous cyst contents without epithelial elements



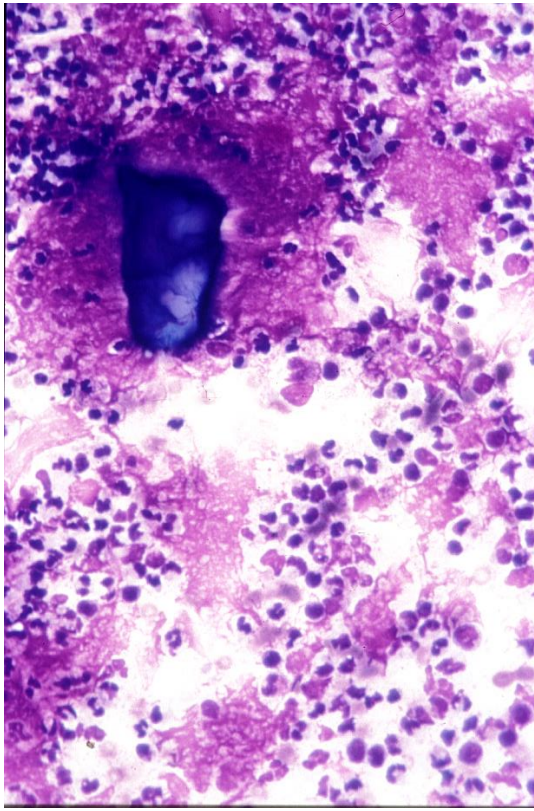
Non-Diagnostic

- Adequacy criteria not clearly established
  - “recommended that until more data is available a minimum of 60 lesional cells, could be used as a reasonable and objective measure of adequacy”
- Excludes cases with significant cytologic atypia
  - AUS
- Excludes mucinous cysts without epithelium
  - AUS
- Excludes abundant inflammatory cells
  - Non-neoplastic
- Excludes aspirates with matrix elements
  - ?Neoplasm:Benign or AUS

Non-Neoplastic

<u>Specimens lacking evidence of a neoplastic process:</u>

- Inflammatory
- Metaplastic
- Reactive
- Examples:
  - Acute, chronic, and granulomatous sialadenitis
  - Sialadenosis
  - Reactive lymph nodes (flow cytometry desirable)
- Clinico-radiological correlation is essential to ensure that the specimen is representative of the lesion



Atypia of Undetermined Significance

Cannot entirely exclude a neoplasm

Heterogeneous category

A majority will be reactive atypia or poorly sampled neoplasms

Specimens are often compromised

- (eg, air-drying, blood clot)

Should be used rarely

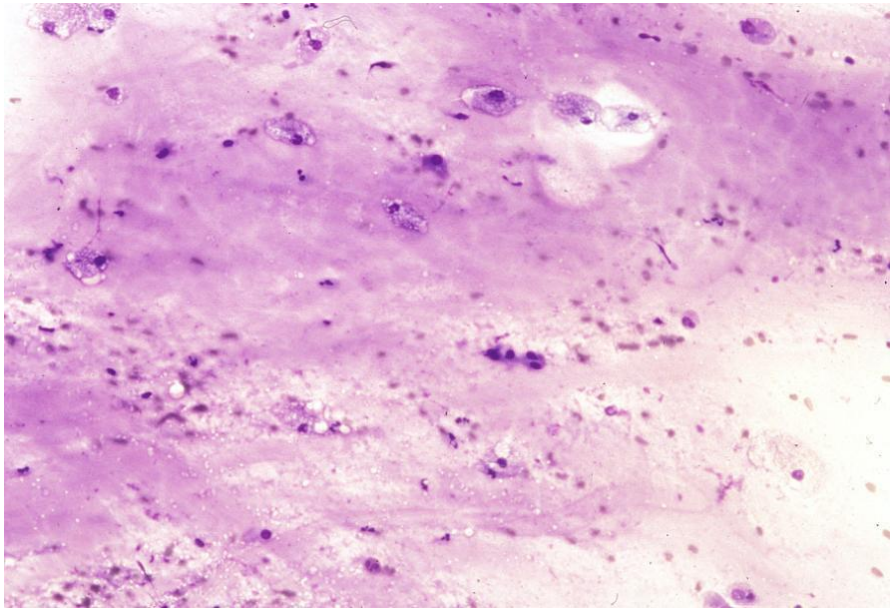
- (<10% of all salivary gland FNAs)

Atypia of Undetermined Significance (AUS)

Cannot entirely exclude a neoplasm

- Reactive/reparative atypia
- Metaplastic changes
- Low cellularity
- Preparation artifact
- Lymphoid lesion

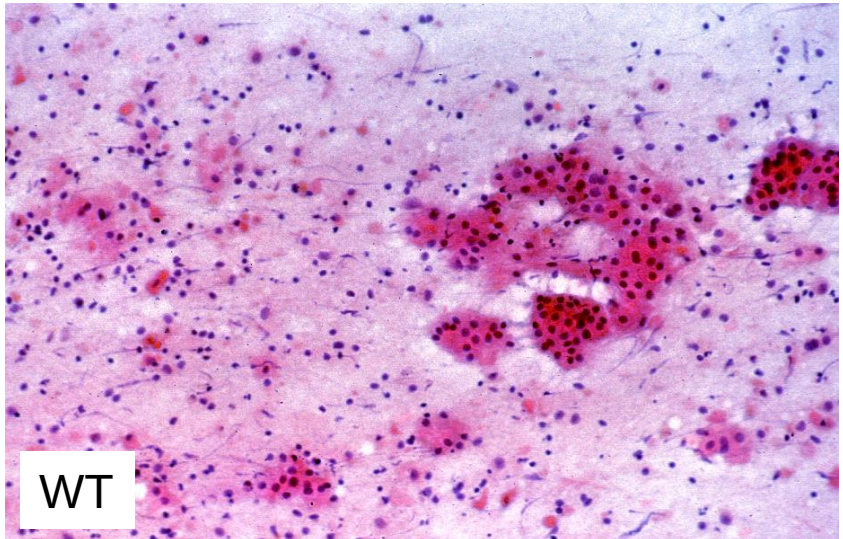
Mucinous cysts with no or limited cellularity

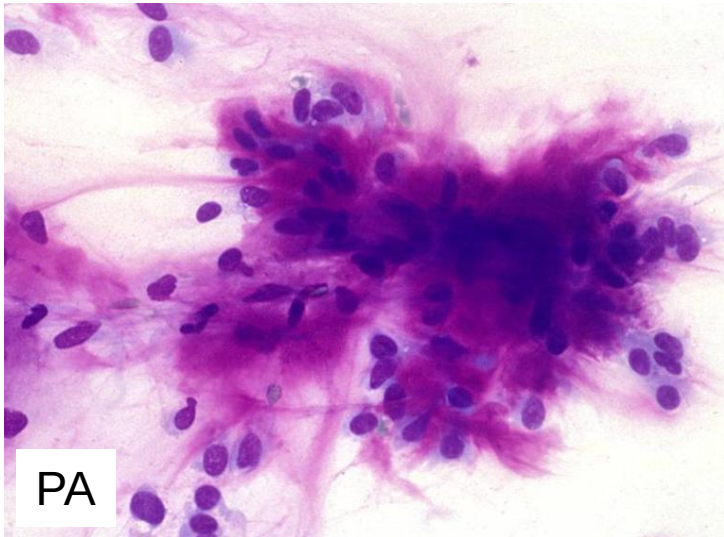


Neoplasm

A) Neoplasm: Benign

- Reserved for clear-cut benign neoplasms
- Includes classic cases of PA, WT, lipoma, etc…

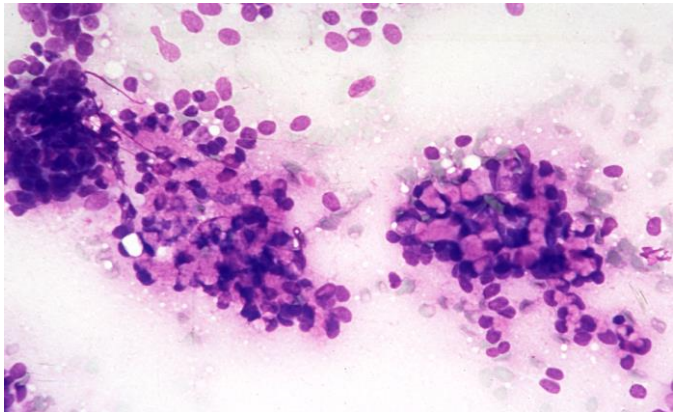


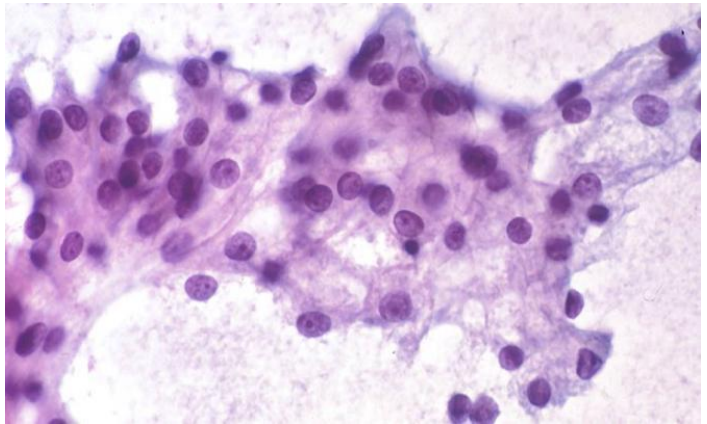


Neoplasm

B) Neoplasm: Salivary Gland Neoplasm of Uncertain Malignant Potential

- Diagnostic of a neoplasm; however, a diagnosis of a specific entity cannot be made
- A malignant neoplasm cannot be excluded
- Three major differentials:
  - -Basaloid
  - -Oncocytic
  - -Clear cell





Suspicious for Malignancy

Aspirates which are highly suggestive of malignancy but not definitive

Often high-grade carcinomas with limited sampling or other limitation

Or neoplastic with limited cytologic features suspicious for a specific malignancy, but not diagnostic (e.g., adenoid cystic, mucoepidermoid, acinic)

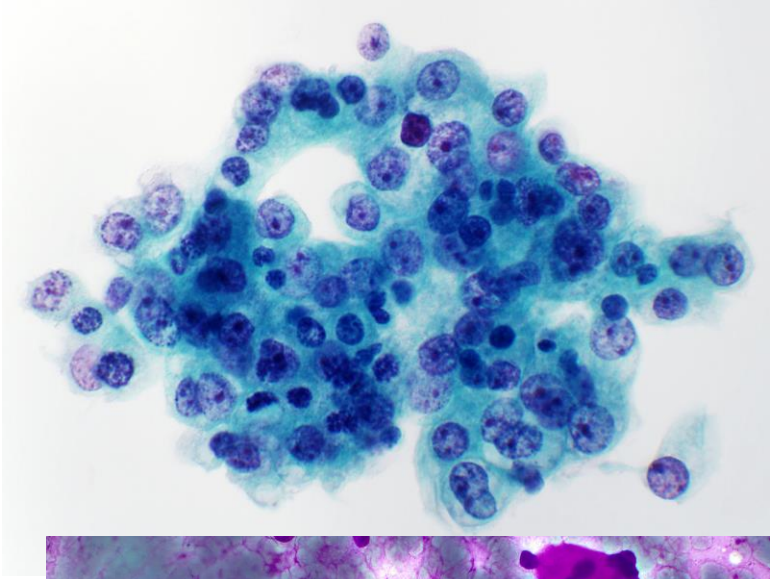
Malignant

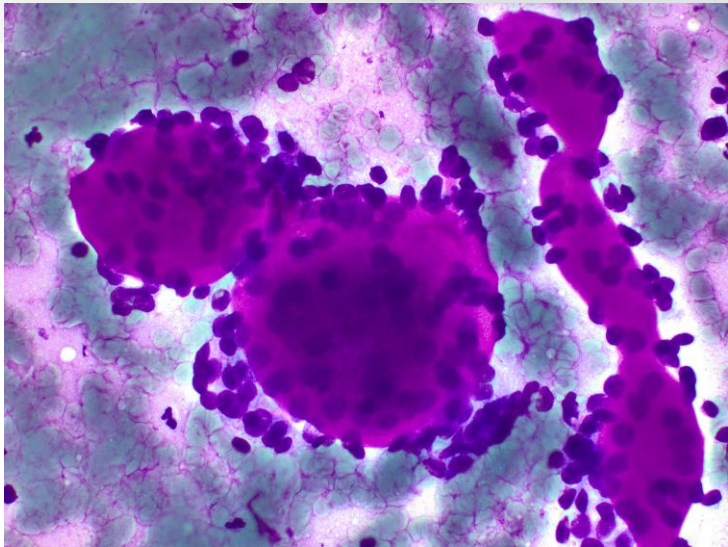
Aspirates which are diagnostic of malignancy

Sub-classify into specific types and grades of carcinoma: e.g. low grade vs high grade

"Other" malignancies

- Lymphomas
- Sarcomas
- Metastases





The Milan System for Reporting Salivary Gland Cytopathology

Overview of Terminology and Reporting

Diagnostic Category	ROM	Management
I. Non-Diagnostic	25%	Clinical and radiologic correlation/ repeat FNA
II. Non-Neoplastic	10%	Clinical follow-up and radiologic correlation
III. Atypia of Undetermined Significance (AUS)	20%	Repeat FNA or surgery
IV. Neoplasm		
A. Benign	<5%	Surgery or Clinical F/U
B. Salivary Gland Neoplasm of Uncertain Malignant Potential (SUMP)	35%	Surgery
V. Suspicious for Malignancy	60%	Surgery
VI. Malignant	90%	Surgery

Ancillary testing

What are the tests?

Which entities are they helpful in diagnosing?

When should we use them?

Surgical Management of Parotid Tumors

- Facial nerve is key
- Benign tumors and low-grade carcinomas
  - “Lumpectomy”/Superficial parotidectomy
  - Observation an option in subset (e.g., WT in elderly patient)
- High-grade carcinomas
  - Total parotidectomy
  - Often accompanied by neck dissection
  - Typically with radiation therapy

NGS on FNA

The PRKD1 E710D Hotspot Mutation Is Highly Specific in Separating Polymorphous Adenocarcinoma of the Palate From Adenoid Cystic Carcinoma and Pleomorphic Adenoma on FNA

Simon Andreasen, MD [1,2]; Linea Cecilie Melchior, PhD[3]; Katalin Kiss, MD[3]; Justin Avery Bishop, MD[4]; Estrid Høgdall, PhD, DMSc [5]; Morten Grauslund, PhD[3]; Irene Wessel, MD, PhD[2]; Preben Homøe, MD, PhD, DMSc[1]; and Tina Klitmøller Agander, MD, PhD[3]

BACKGROUND: Polymorphous adenocarcinoma (PAC) of the palatal minor salivary glands, previously known as polymorphous low-grade adenocarcinoma, is the second most common intraoral malignant salivary gland carcinoma after adenoid cystic carcinoma (ACC) and carries an excellent prognosis. Unfortunately, PAC demonstrates cytological overlap with 2 other salivary gland tumors frequently encountered in the same location, namely ACC and pleomorphic adenoma (PA). Recently, the protein kinase D1 (*PRKD1*) hotspot mutation E710D was demonstrated to be specific for PAC and to be present in the majority of cases. The objective of the current study was to investigate the value of *PRKD1* hotspot sequencing in identifying PAC in paired fine-needle aspiration (FNA) and surgical specimens from cases of PAC, ACC, and PA. **METHODS:** Paired May-Grunwald-Giemsa-stained FNA and corresponding surgical specimens were collected from 18 PAC cases, 25 ACC cases, and 21 PA cases. Both sets of specimens were subjected to dideoxynucleotide sequencing of *PRKD1* exon 15, including the PRKD1 E710D hotspot. **RESULTS:** Of the PAC cases, approximately 50% demonstrated identical PRKD1 E710D hotspot mutations on the FNA specimen and corresponding surgical specimen. Two ACC specimens had point mutations within the sequenced region in the FNA specimen as well as the surgical specimen, but none were located in the hotspot region. None of the PA cases demonstrated *PRKD1* mutations. The specificity of the *PRKD1* hotspot mutation for identifying PAC among ACC and PA cases was 100% whereas the sensitivity was 50%. **CONCLUSIONS:** The *PRKD1* E710D hotspot mutation is highly specific for identifying PAC on FNA among cases of ACC and PA, whereas the sensitivity is only modest. Alternative *PRKD1* mutations exclude PAC, and are more suggestive of ACC. ***Cancer Cytopathol* 2018;126:275-81.** © *2017 American Cancer Society.*

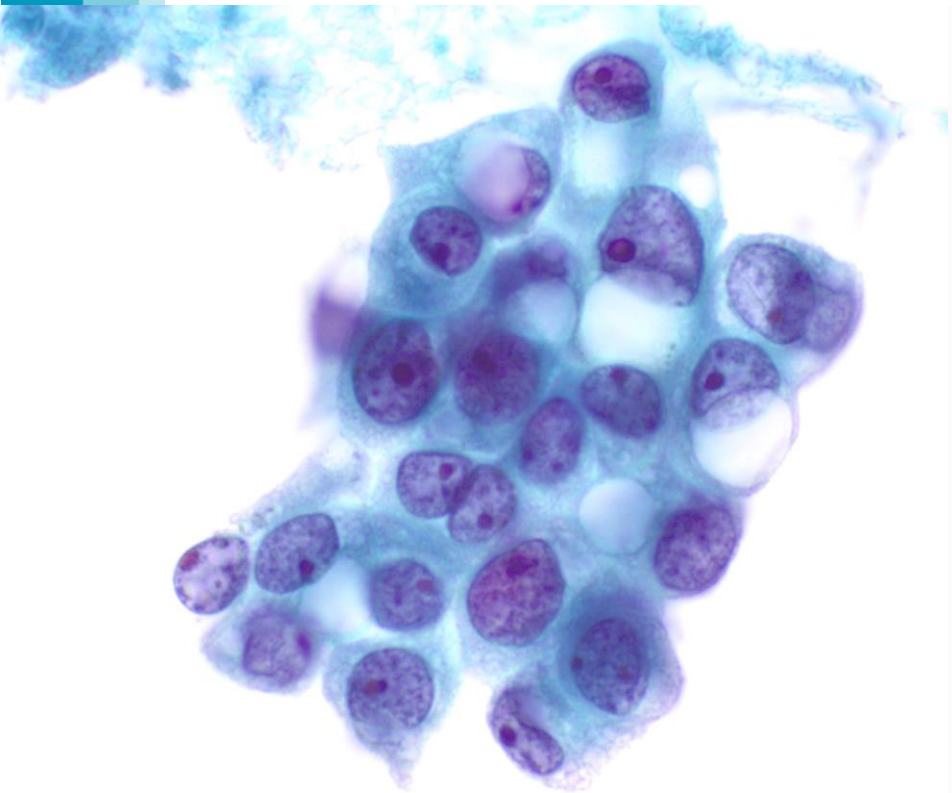
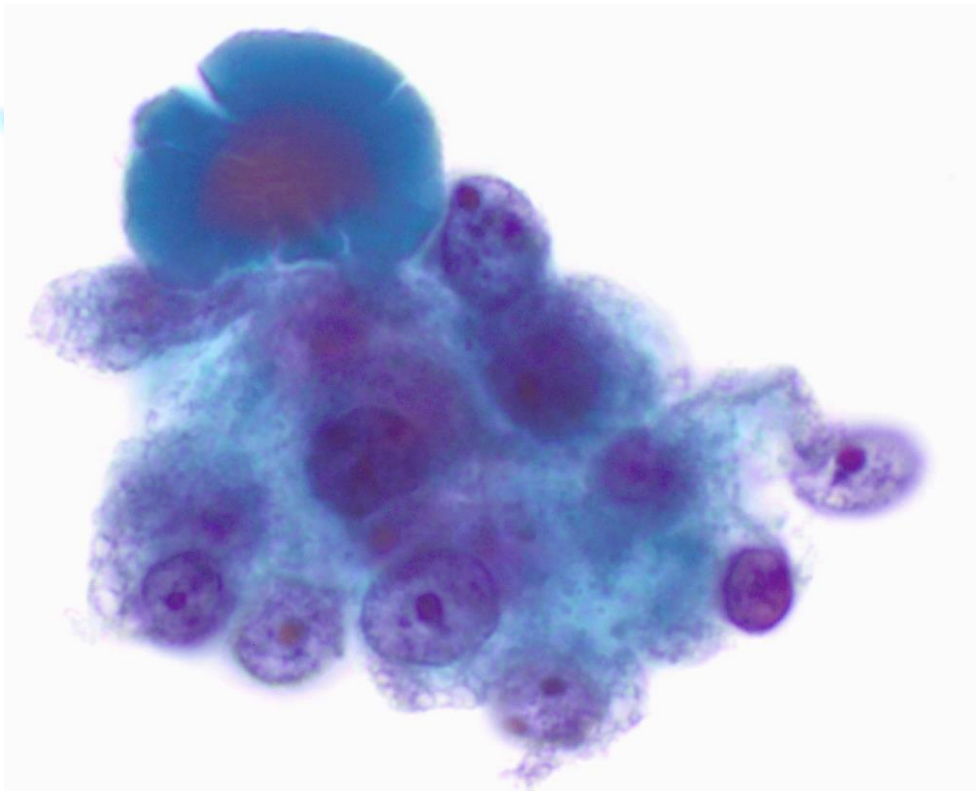
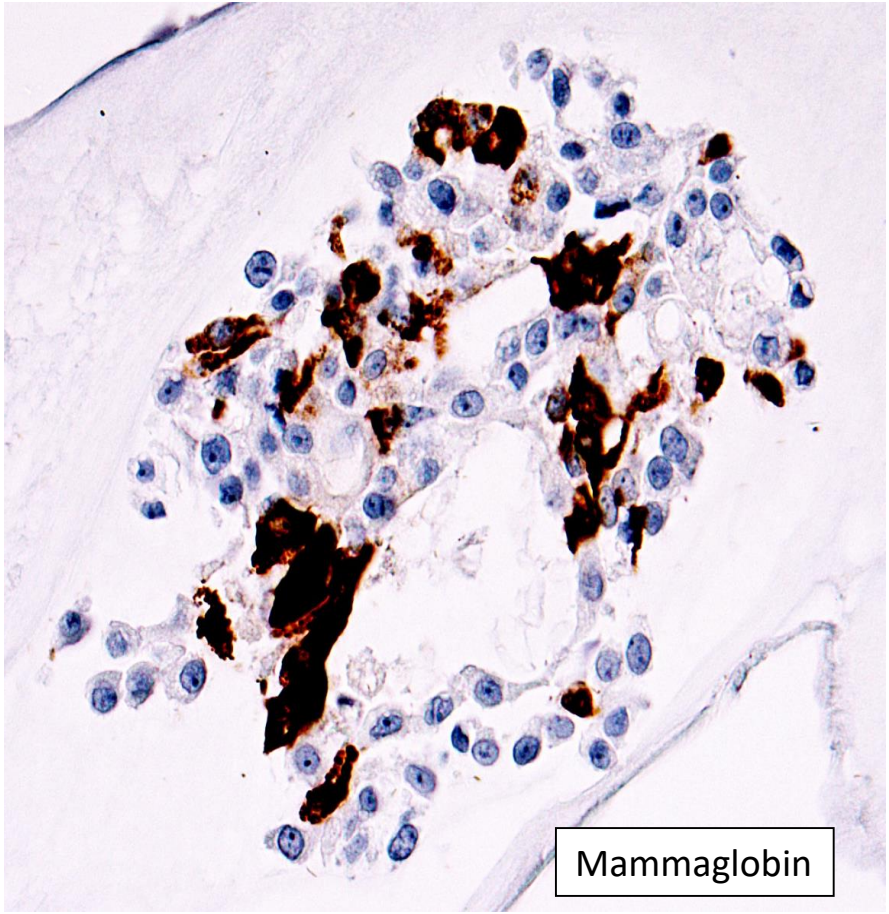
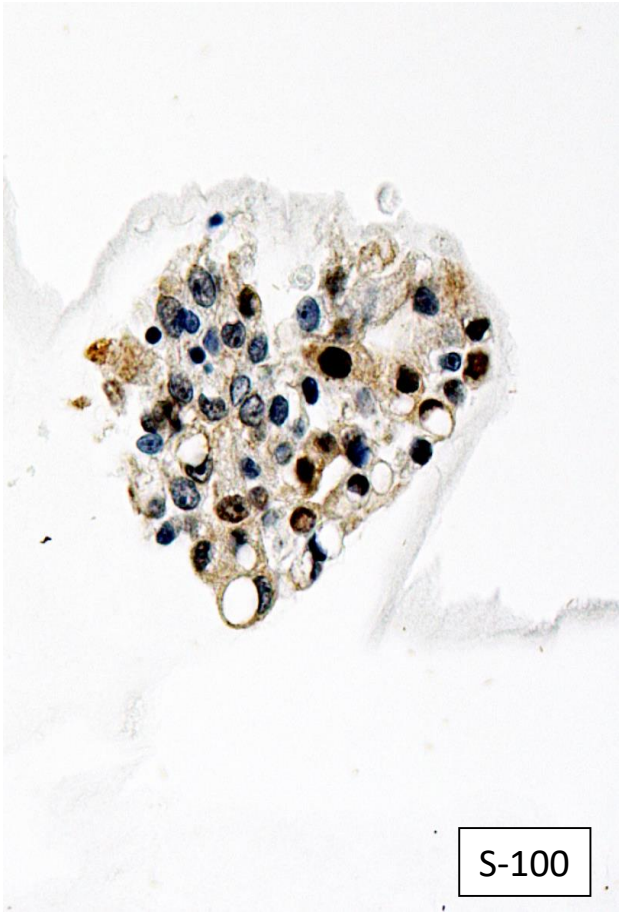
Case:
?High-grade mucoepidermoid carcinoma





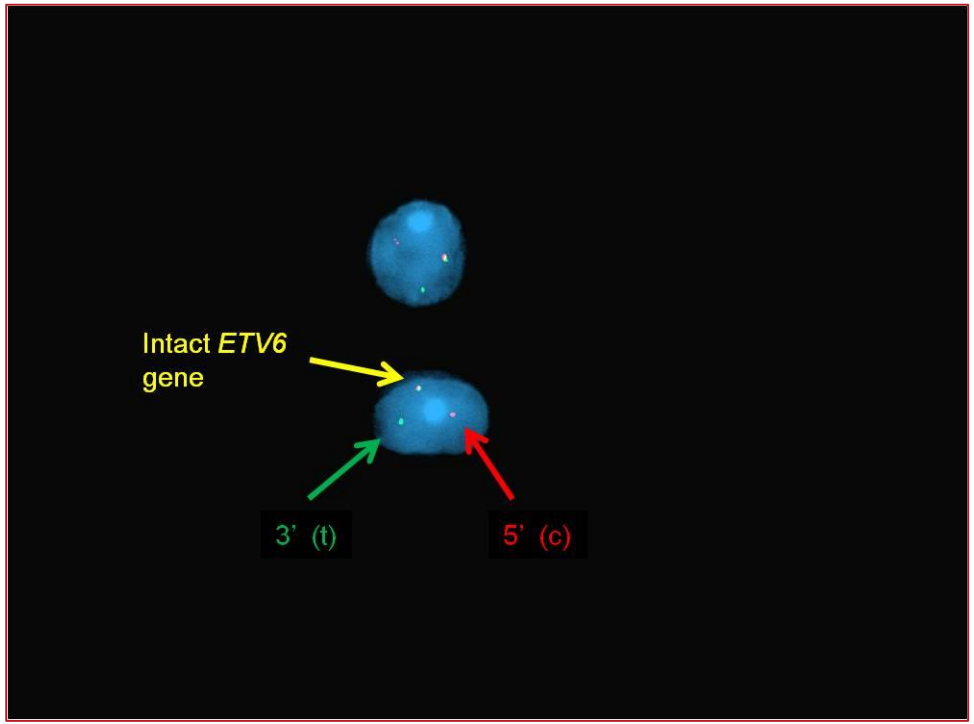


Mammaglobin



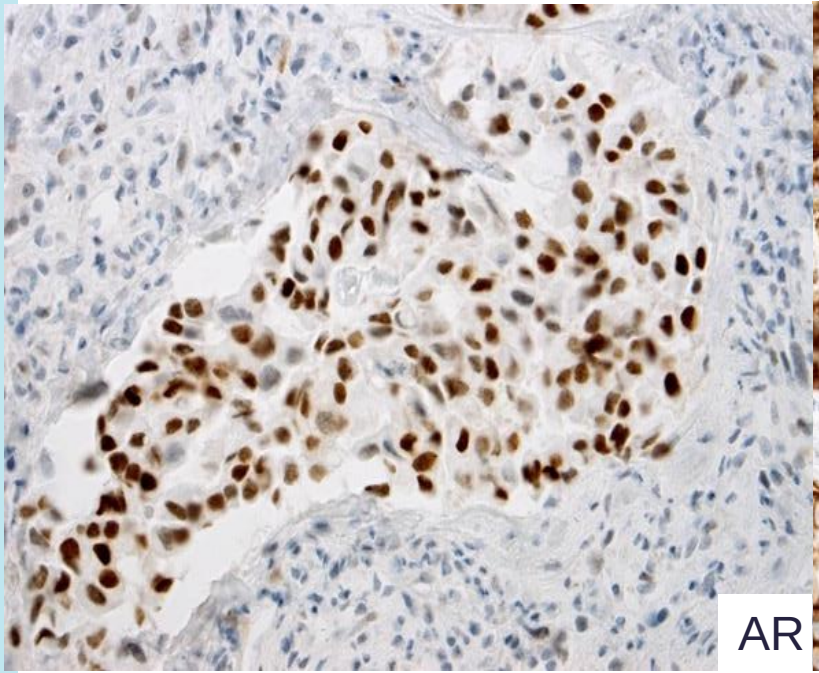
S-100

(Mammary analogue) Secretory carcinoma

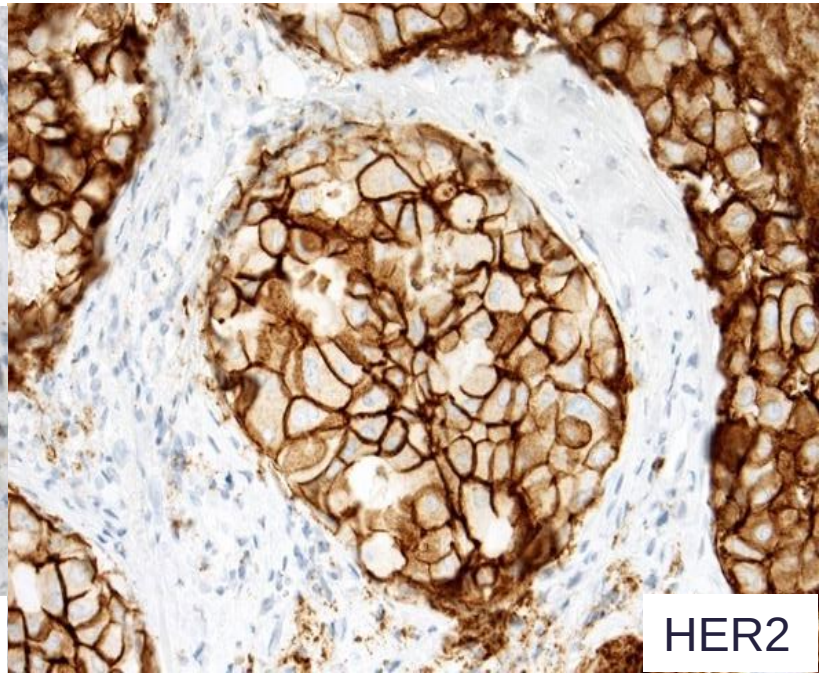


Salivary duct carcinoma
Therapeutic as well as diagnostic utility

Anti-androgenic agents



Herceptin



Salivary Duct Carcinoma

- Subset are SDC ex PA
  - Distinct molecular profile
    - More likely HER2+
  - PLAG1 or HMGA2 expression if rearrangement present
  - Precursor PA may not be sampled and/or focal

What should our expectations be for ancillary testing of salivary gland FNA?

Benefits

Minimizes diagnostic uncertainty

Refines risk stratification

Optimizes patient management

Promotes clinician confidence

Obstacles

ROSE availability

Technical expertise

Time

Financial costs

Final thoughts on ancillary testing

Milan system recognizes the value of ancillary techniques, but is not proscriptive

Provides a framework for deciding what makes sense in your lab while balancing

- Optimal performance of salivary gland FNA
- Clinical expectations and needs
- Available resources

One year in, where does Milan system stand?

Category use

11 retrospective studies since 2018

Diagnostic Category	Median	Range
I. Non-Diagnostic	13.5%	2.8-23%
II. Non-Neoplastic	23%	7-42%
III. Atypia of Undetermined Significance (AUS)	3.2%	2-10.8%
IV. Neoplasm		
A. Benign	36.9%	27.9-51.4%
B. Salivary Gland Neoplasm of Uncertain Malignant Potential (SUMP)	5.4%	1.3-14.2%
V. Suspicious for Malignancy	2.4%	1.2-14%
VI. Malignant	9.4%	2.5-17%

Summary

The Milan System for Reporting Salivary Gland Cytopathology:

1. **Standardizes reporting terminology**
2. **Provides risk stratification**
3. **Guides clinical management**

Ancillary testing can improve performance of, and increase confidence in, The Milan System

Early data are largely encouraging regarding its use

Pearls of Pathology

Use Milan System terminology

Consider ancillary testing to:

1. **Resolve diagnostic uncertainty**
2. **Change the Milan System category**
3. **Improve risk stratification**
4. **Guide clinical management**
