

Gynecologic and Gastrointestinal Pathology: Pitfalls and Pearls in Frozen Section Diagnosis

Johanna Savage, MD
University of Utah Health/ARUP Laboratories

32nd Annual Park City Anatomic Pathology Update
Deer Valley Resort, Park City, UT
February 13, 2019

Gynecologic Pathology

Johanna M. Savage, M.D.

Assistant Professor of Pathology

University of Utah Health/ARUP Laboratories

OBJECTIVES

Not an “all inclusive” presentation

- Discuss goals of frozen section analysis in gynecologic pathology
- Discuss common diagnostic difficulties and sources of error in frozen section analysis of ovarian neoplasms
- Discuss diagnostic difficulties and sources of error in frozen section analysis of endometrial lesions

OVARIAN NEOPLASMS

Pearls...

GUIDING PRINCIPALS (*before you look at the slides*)

1. Know the patient's history

- Age
- Previous history of malignancy

2. Know the clinical presentation

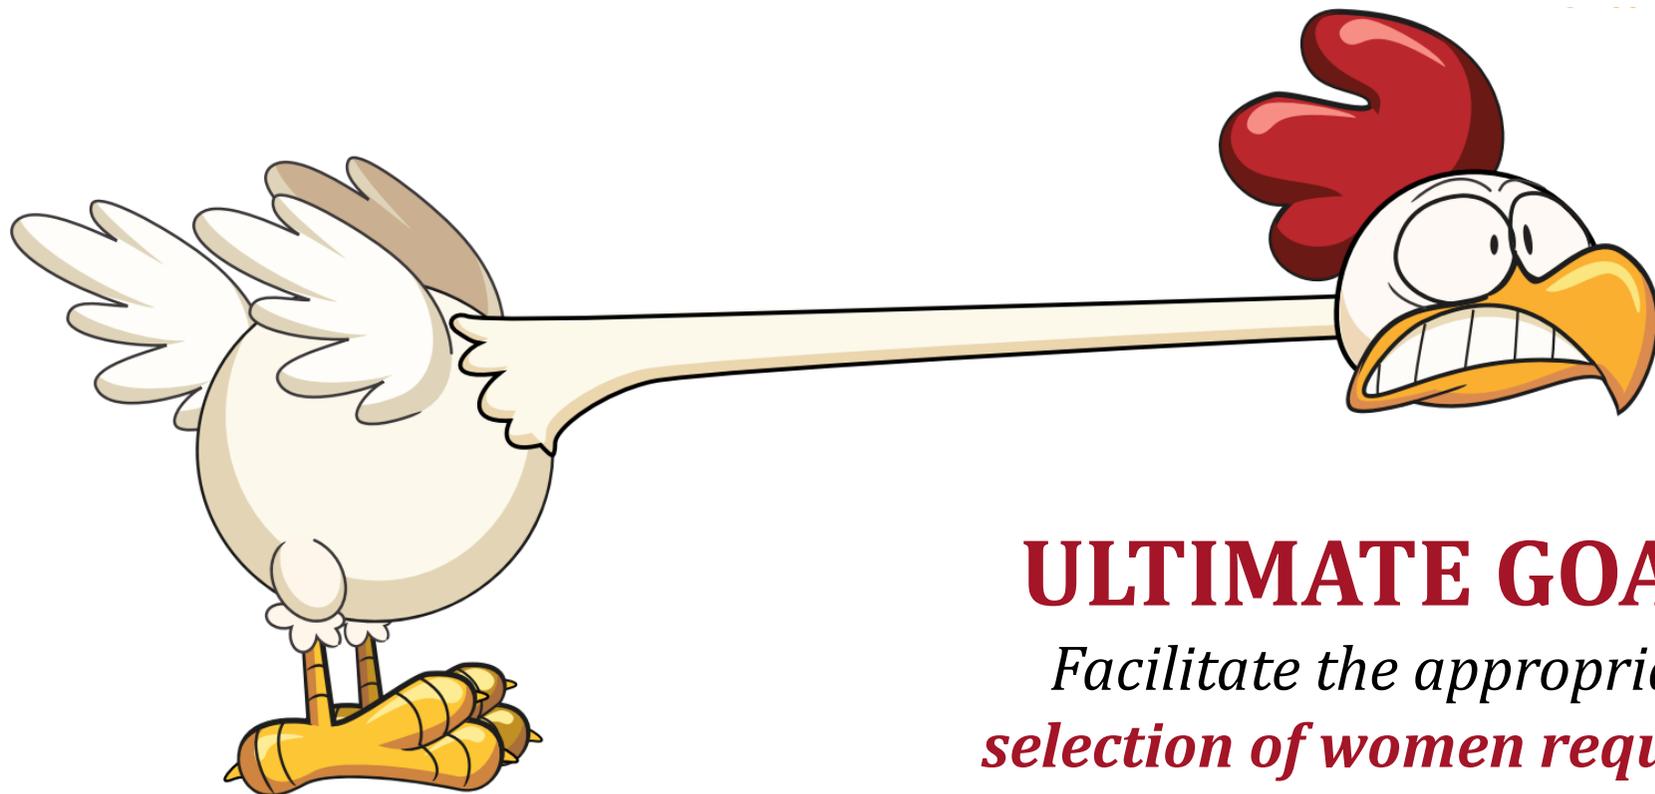

- Radiology (and/or operative findings)
 - Where is the mass arising from?
 - Laterality – Unilateral or bilateral?
 - Extraovarian disease?
- Serum tumor markers
 - CA125
 - CEA
 - AFP
 - Etc.

3. Look at the gross specimen

- Size
- Surface growth?
- Cut surface consistency: Solid? Cystic? Papillary excrescences?
- Cyst contents/fluid
- Color

KNOW THE DECISION POINT(S)

How far should I “stick my neck out”?
What does the surgeon need to know?

ULTIMATE GOAL:
*Facilitate the appropriate
selection of women requiring
surgical staging*

DECISION POINTS

1

Is the neoplasm a primary ovarian neoplasm or a metastasis?

2

3

EPITHELIAL OVARIAN NEOPLASMS

NCCN Guidelines Version 2.2018
Ovarian Cancer
NCCN Evidence Blocks™

WHO HISTOLOGIC CLASSIFICATION^{1,2}

Serous Tumors <ul style="list-style-type: none"> • Serous cystadenoma • Serous adenofibroma • Serous surface papilloma • Serous borderline tumor/atypical proliferative serous tumor • Serous borderline tumor-micropapillary variant/non-invasive low-grade serous carcinoma • Low-grade serous • High-grade serous 	Benign Benign Benign Borderline Carcinoma in-situ/ grade III intraepithelial neoplasia Malignant Malignant
Mucinous Tumors <ul style="list-style-type: none"> • Mucinous cystadenoma • Mucinous adenofibroma • Mucinous borderline tumor/atypical proliferative mucinous tumor • Mucinous carcinoma 	Benign Benign Borderline Malignant
Endometrioid Tumors <ul style="list-style-type: none"> • Endometriotic cyst • Endometriotic cystadenoma • Endometriotic adenofibroma • Endometrioid borderline tumor/atypical proliferative endometrioid tumor • Endometrioid carcinoma 	Benign Benign Benign Borderline Malignant
Clear Cell Tumors <ul style="list-style-type: none"> • Clear cell cystadenoma • Clear cell adenofibroma • Clear cell borderline tumor/atypical proliferative clear cell tumor • Clear cell carcinoma 	Benign Benign Borderline Malignant

Brenner Tumors <ul style="list-style-type: none"> • Brenner tumor • Borderline Brenner tumor/atypical proliferative Brenner tumor • Malignant Brenner tumor 	Benign Borderline Malignant
Seromucinous Tumors <ul style="list-style-type: none"> • Seromucinous cystadenoma • Seromucinous adenofibroma • Seromucinous borderline tumor/atypical proliferative seromucinous tumor • Seromucinous carcinoma 	Benign Benign Borderline Malignant
Undifferentiated carcinoma	Malignant
Mesenchymal Tumors <ul style="list-style-type: none"> • Low-grade endometrioid stromal sarcoma • High-grade endometrioid stromal sarcoma 	Malignant Malignant
Mixed Epithelial & Mesenchymal Tumors <ul style="list-style-type: none"> • Adenosarcoma • Carcinosarcoma 	Malignant Malignant

CRITICAL POINT: ATYPICAL PROLIFERATIVE (BORDERLINE)

Epithelial ovarian neoplasms (serous, mucinous, endometrioid, transitional cell/Brenner) with uncertain biologic behavior

- Most behave in a benign/indolent fashion
- But... a small proportion (predominantly serous) can recur and progress

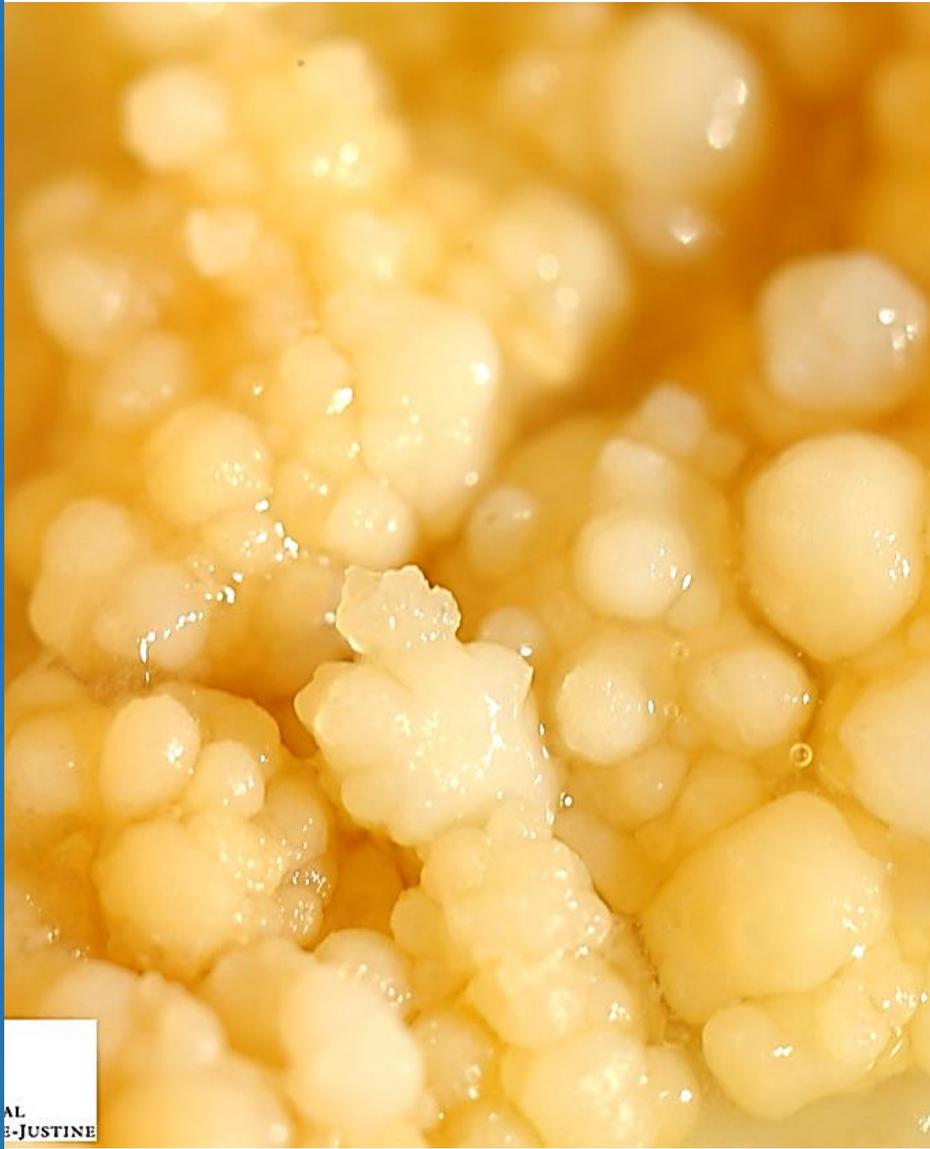

- Getting to the correct diagnosis
 - Under diagnosis
 - Sampling errors
 - Interpretive errors
 - Over diagnosis

- Should I completely stage the patient?
- Should I perform some type of modified staging?
 - ✓ Frozen section diagnosis
 - ✓ Age
 - ✓ Fertility desires
 - ✓ Other operative findings

*Serous
Neoplasms*

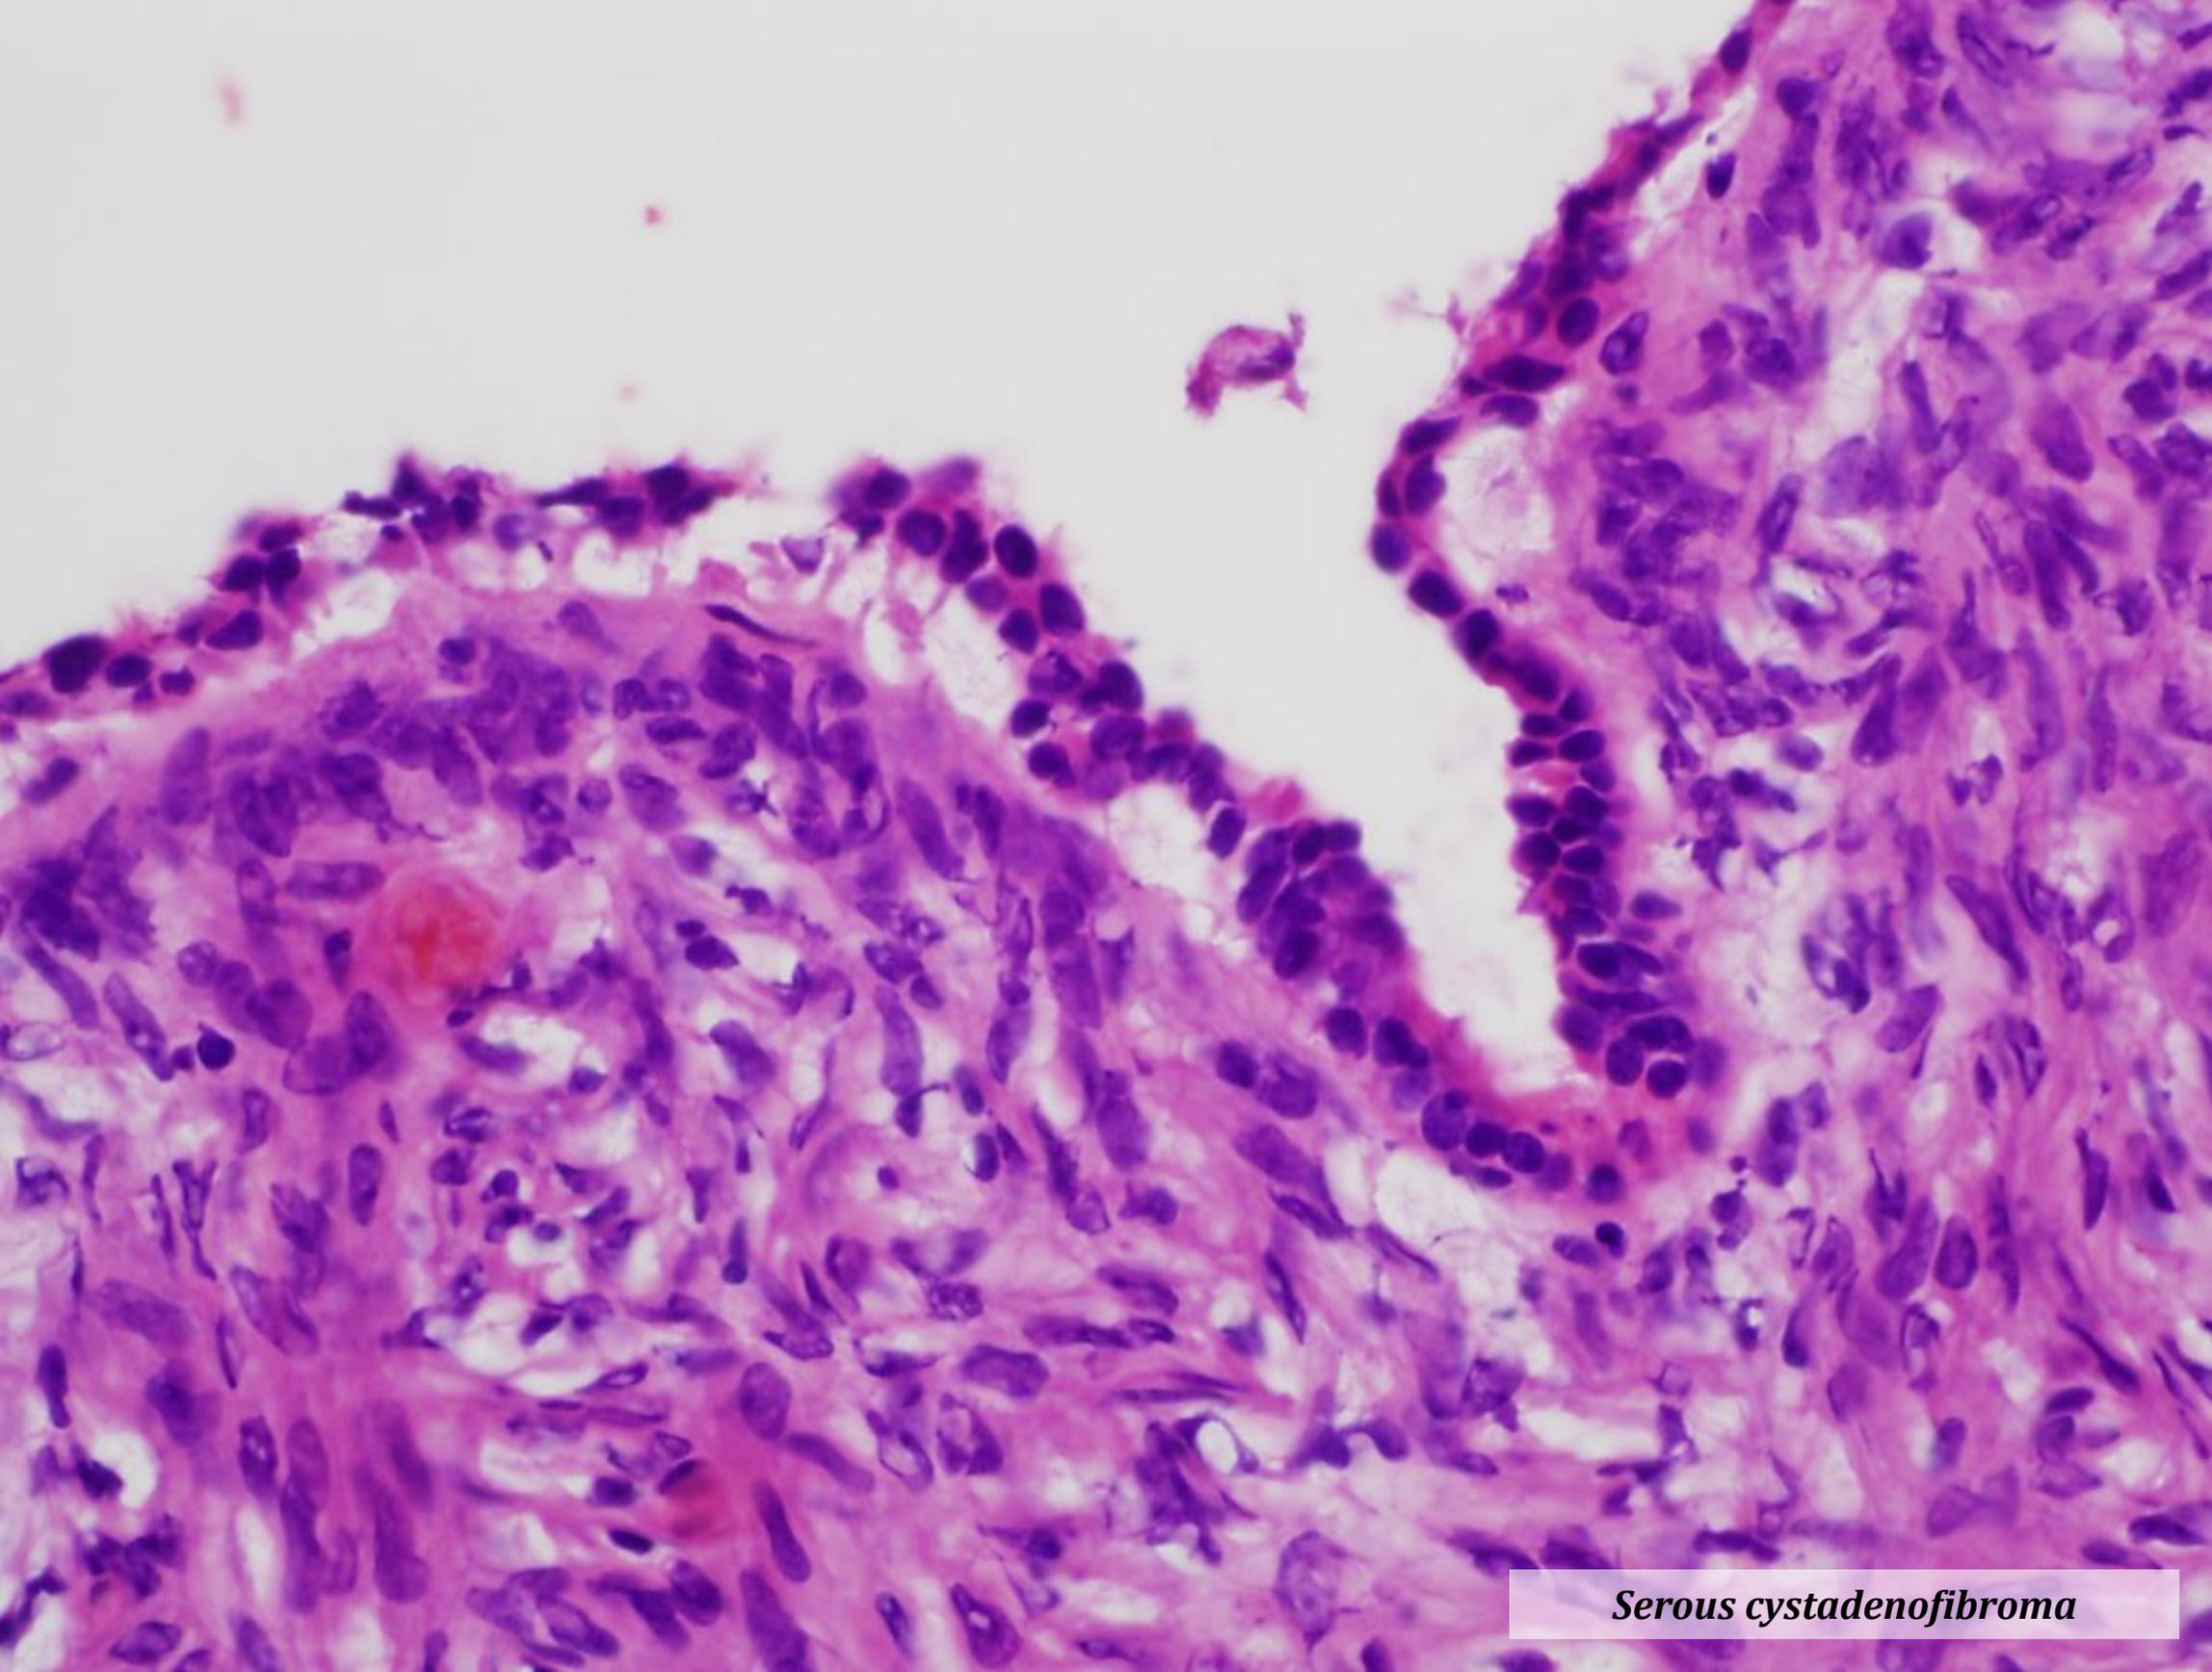

HÔPITAL
SAINTE-JUSTINE

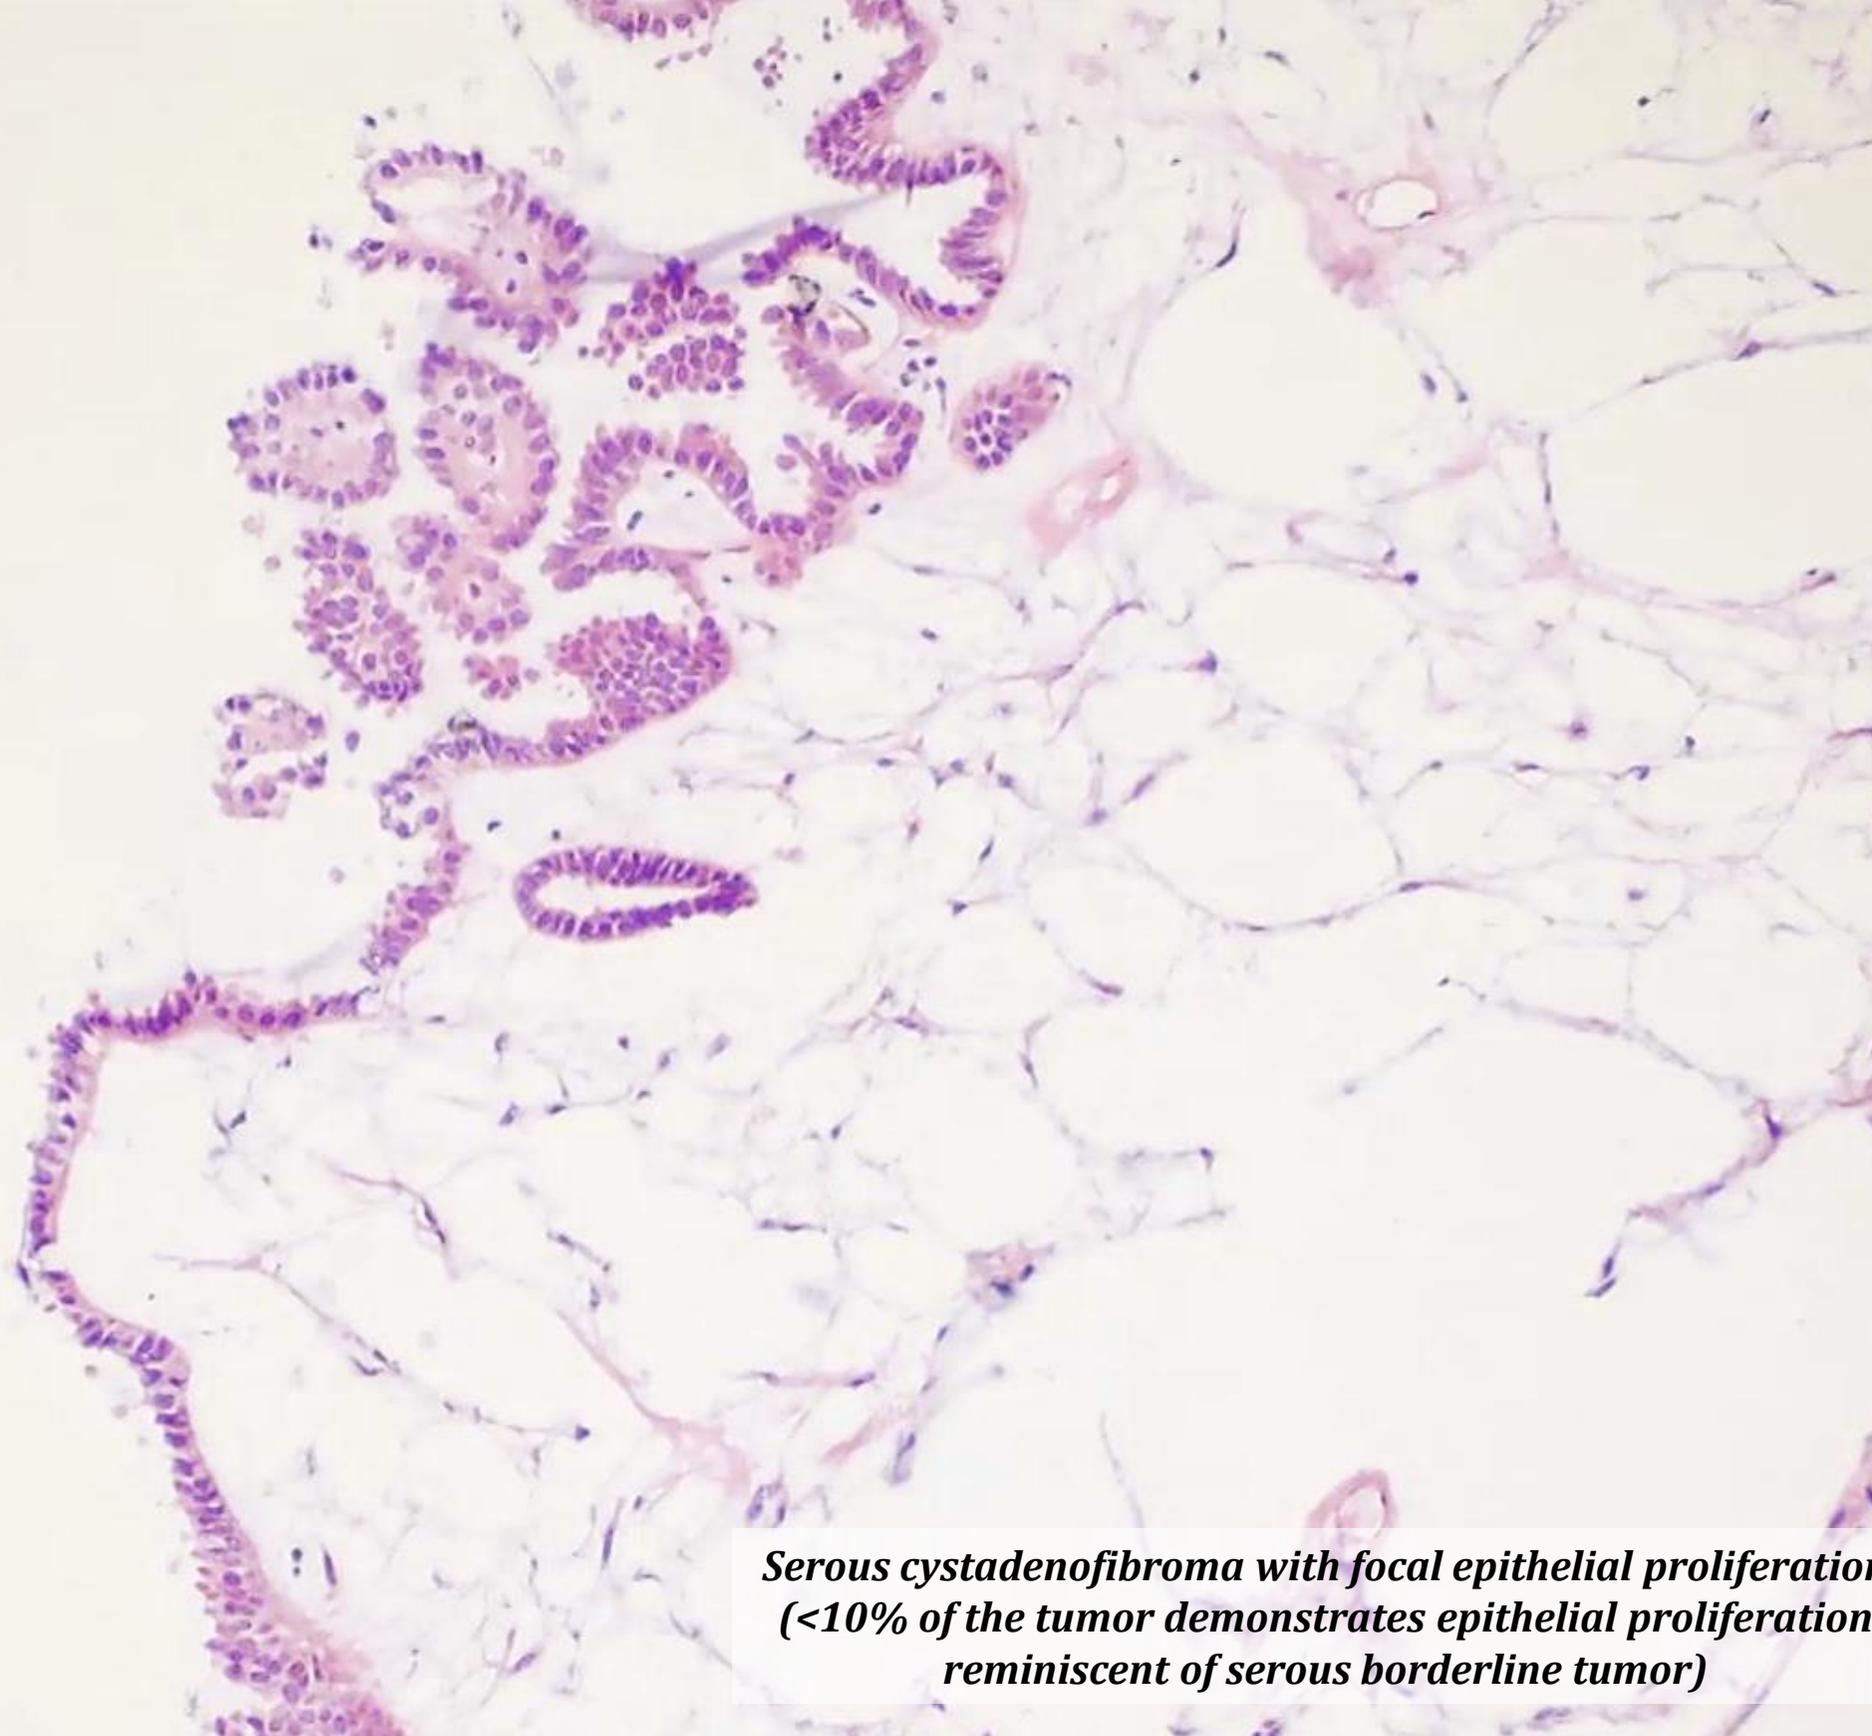

1 cm

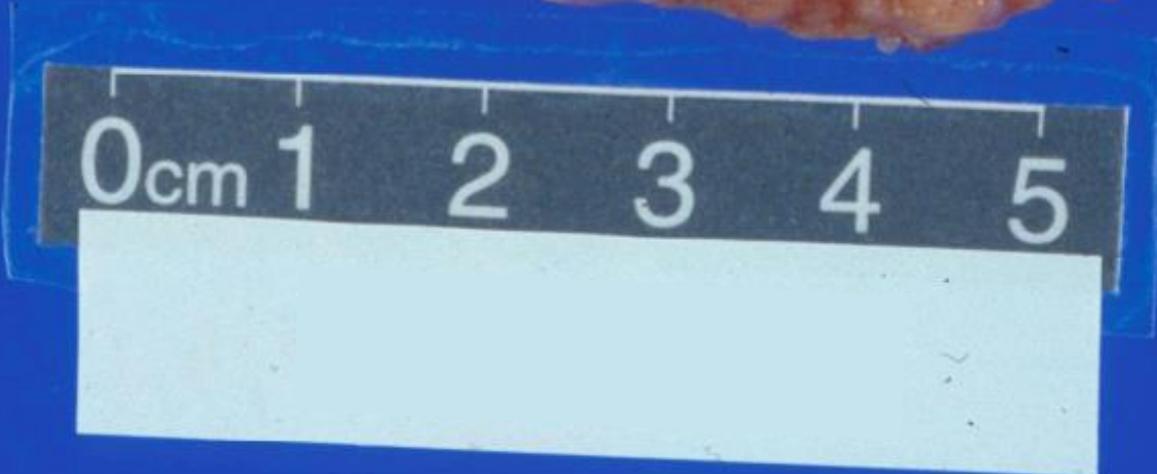

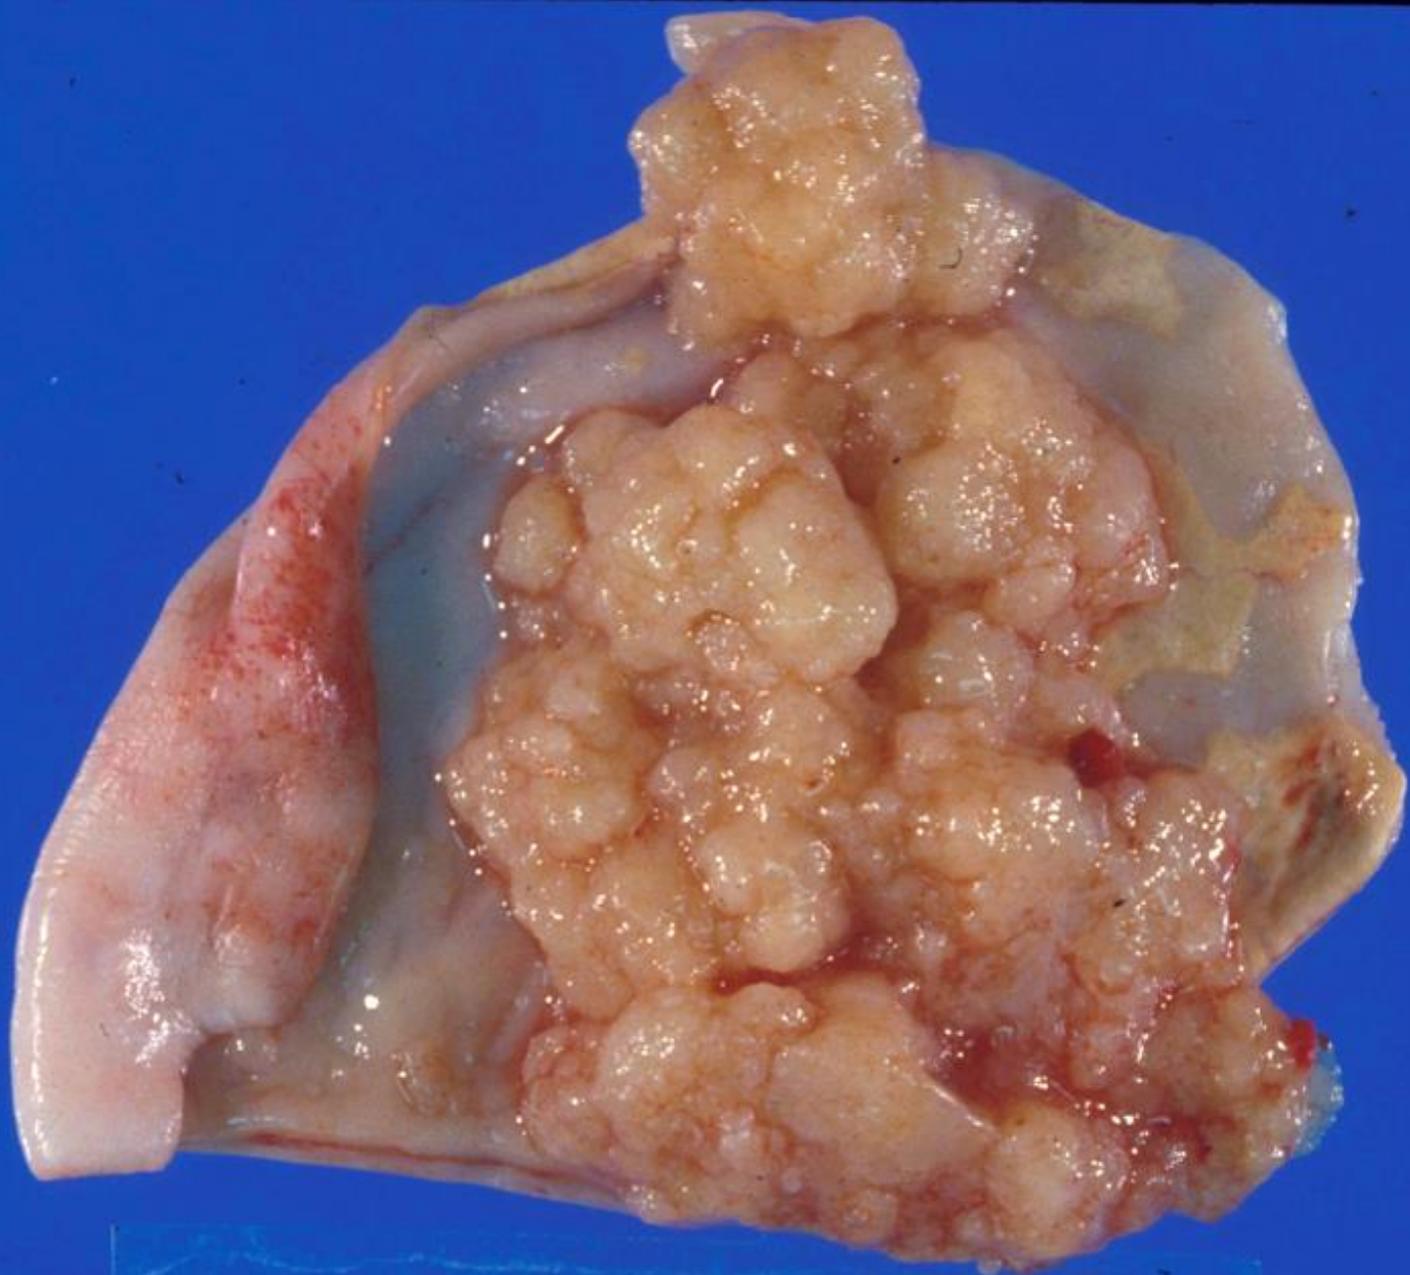

Serous cystadenofibroma

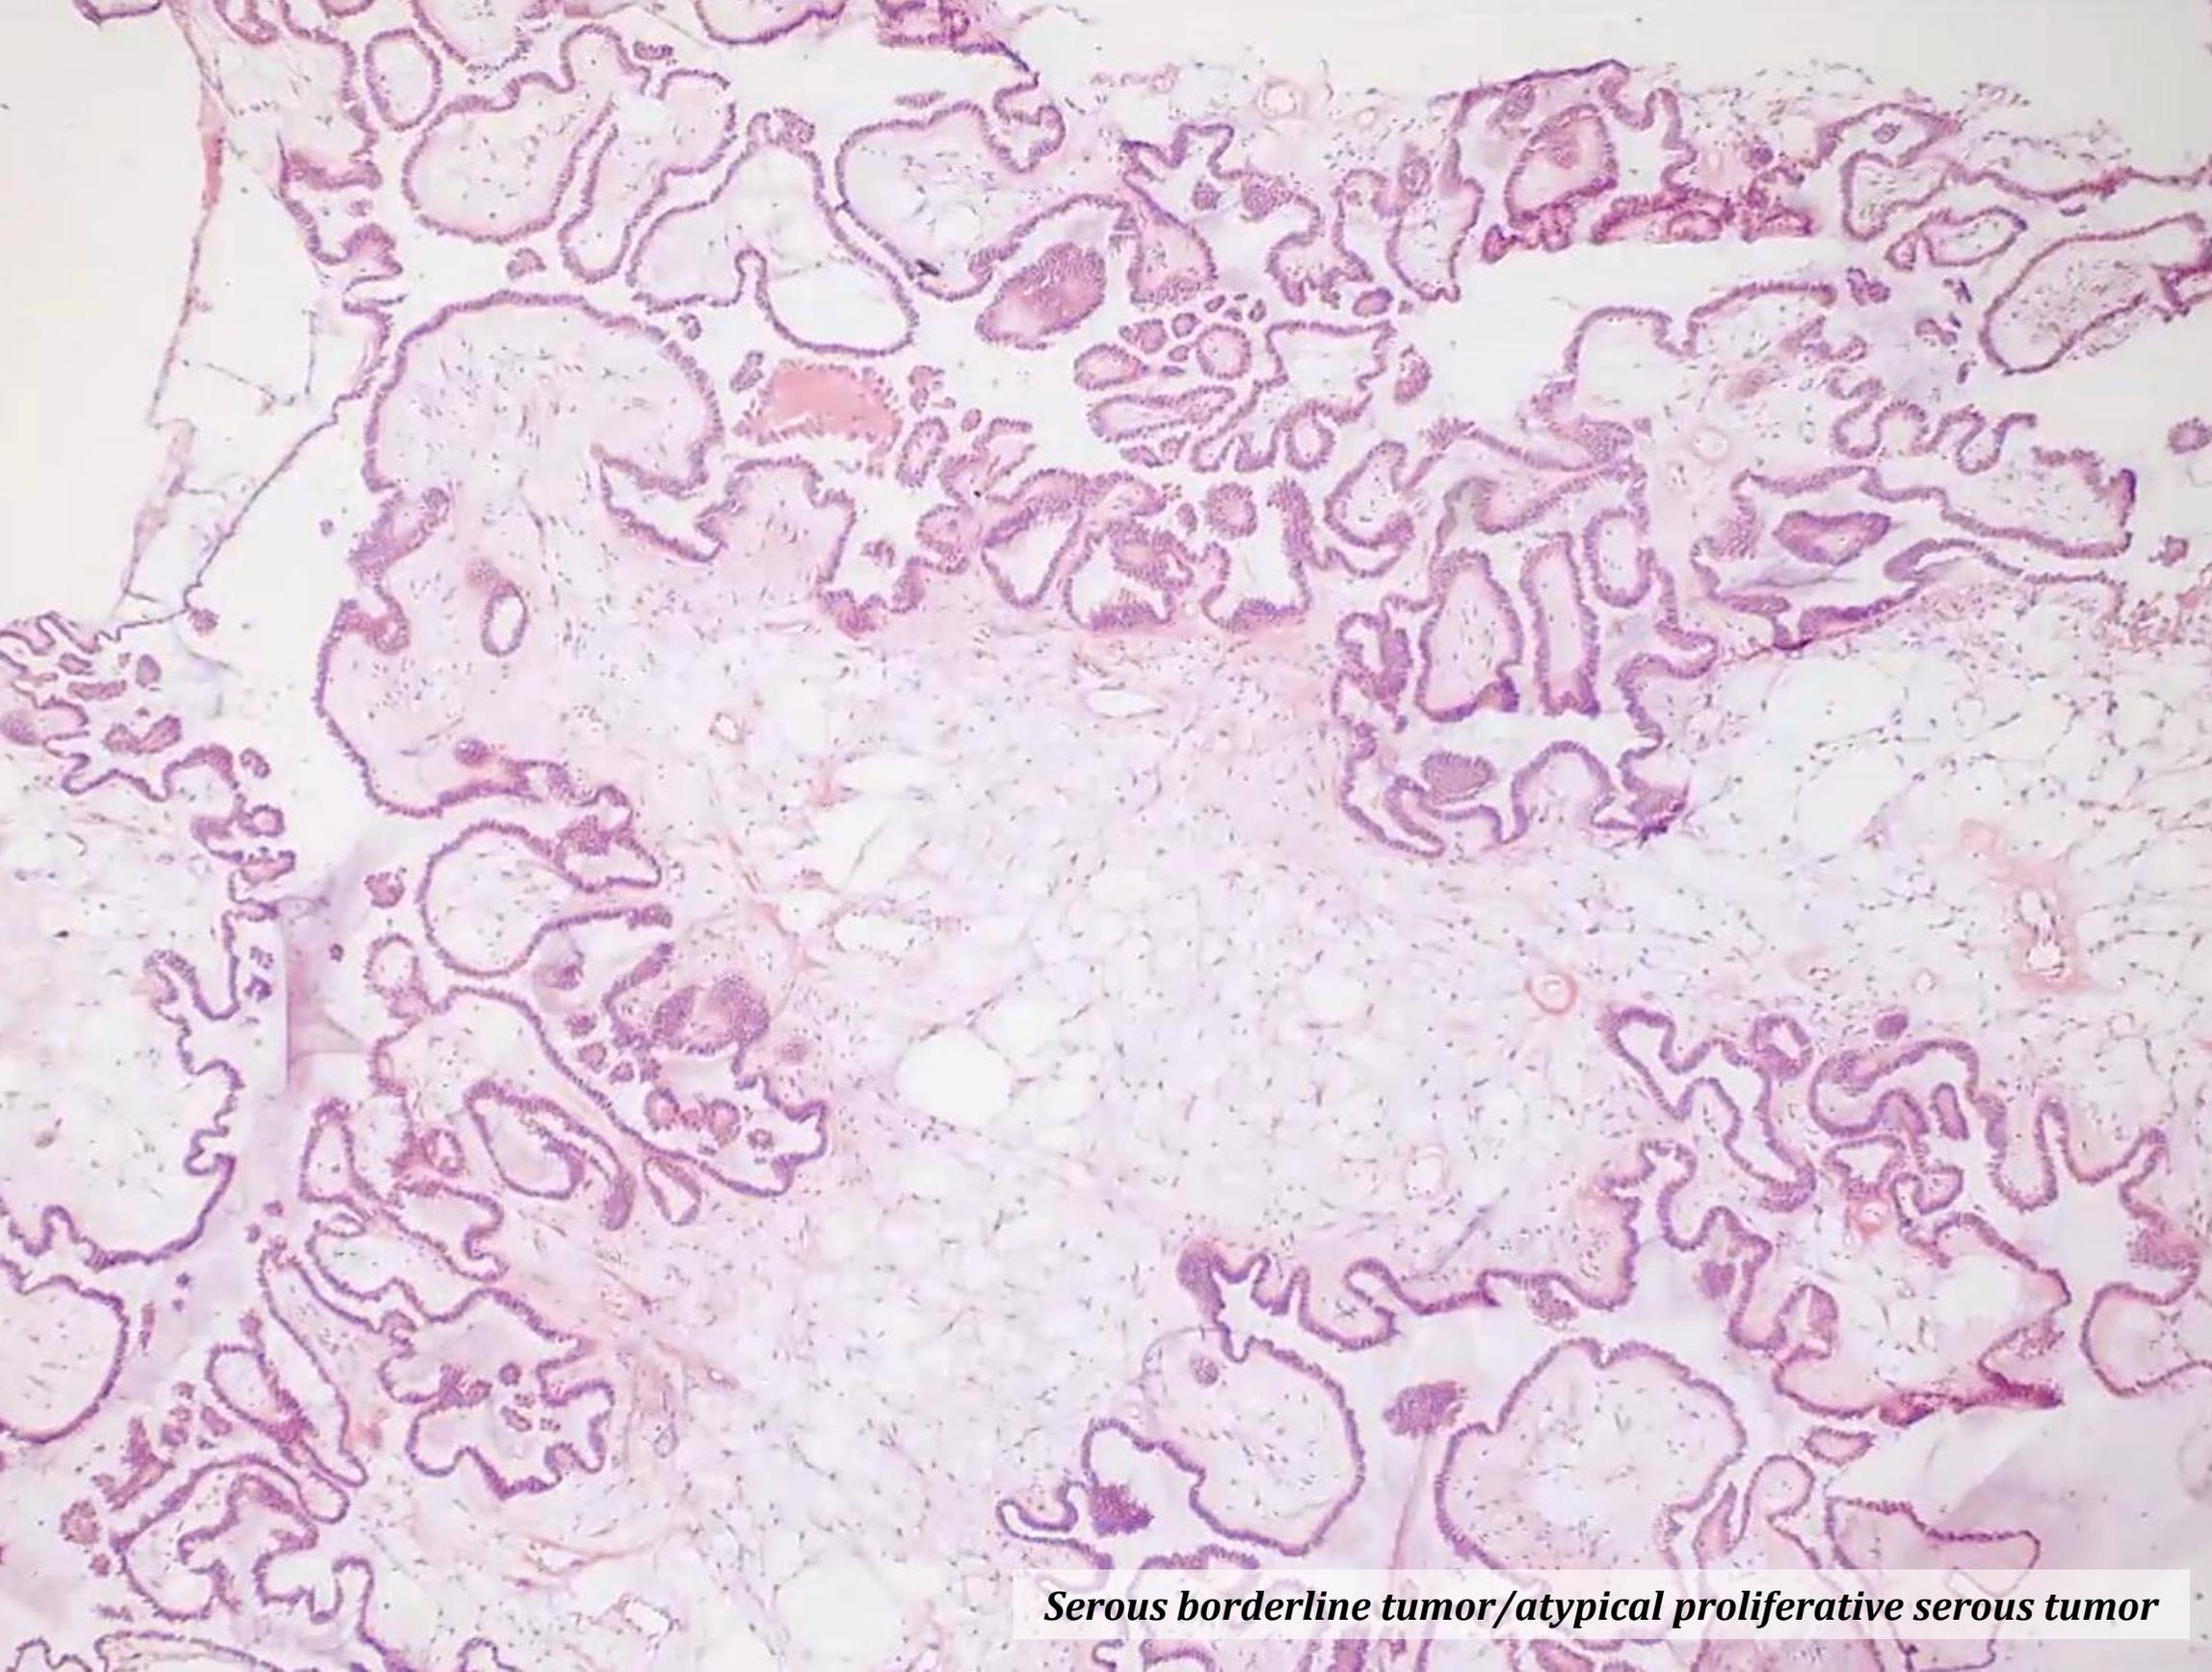

Serous cystadenofibroma

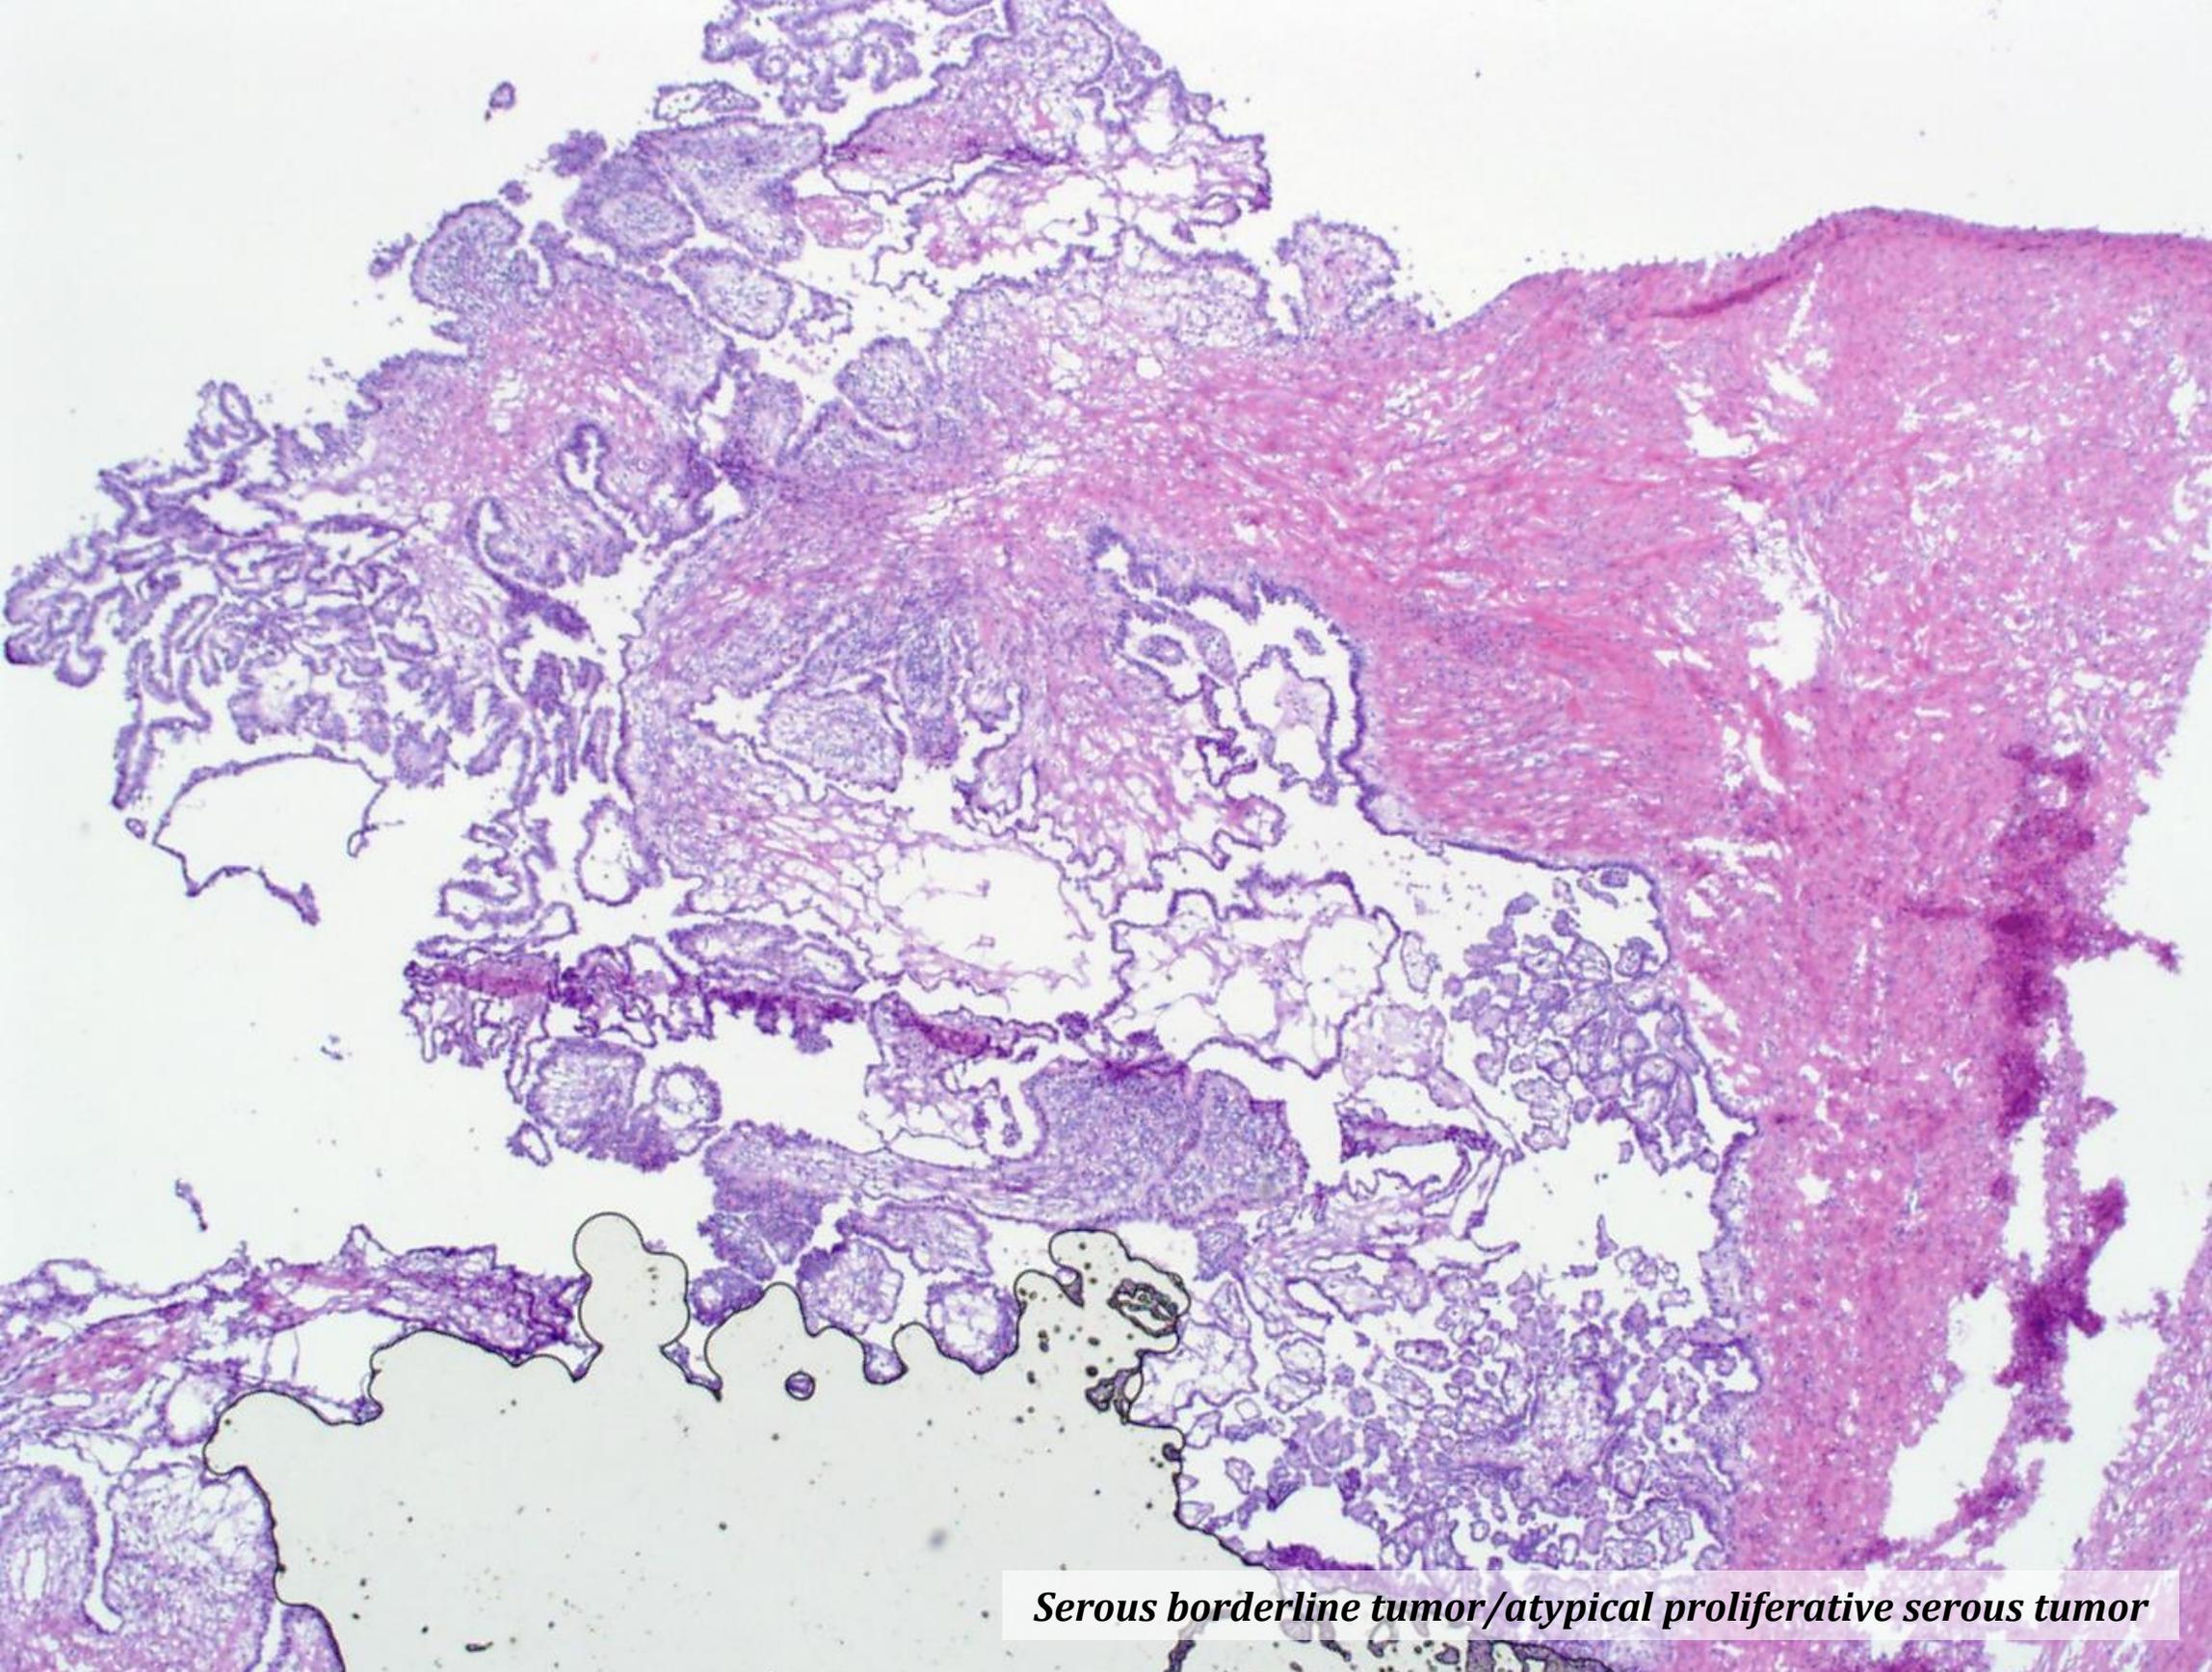

***Serous cystadenofibroma with focal epithelial proliferation
($<10\%$ of the tumor demonstrates epithelial proliferation
reminiscent of serous borderline tumor)***

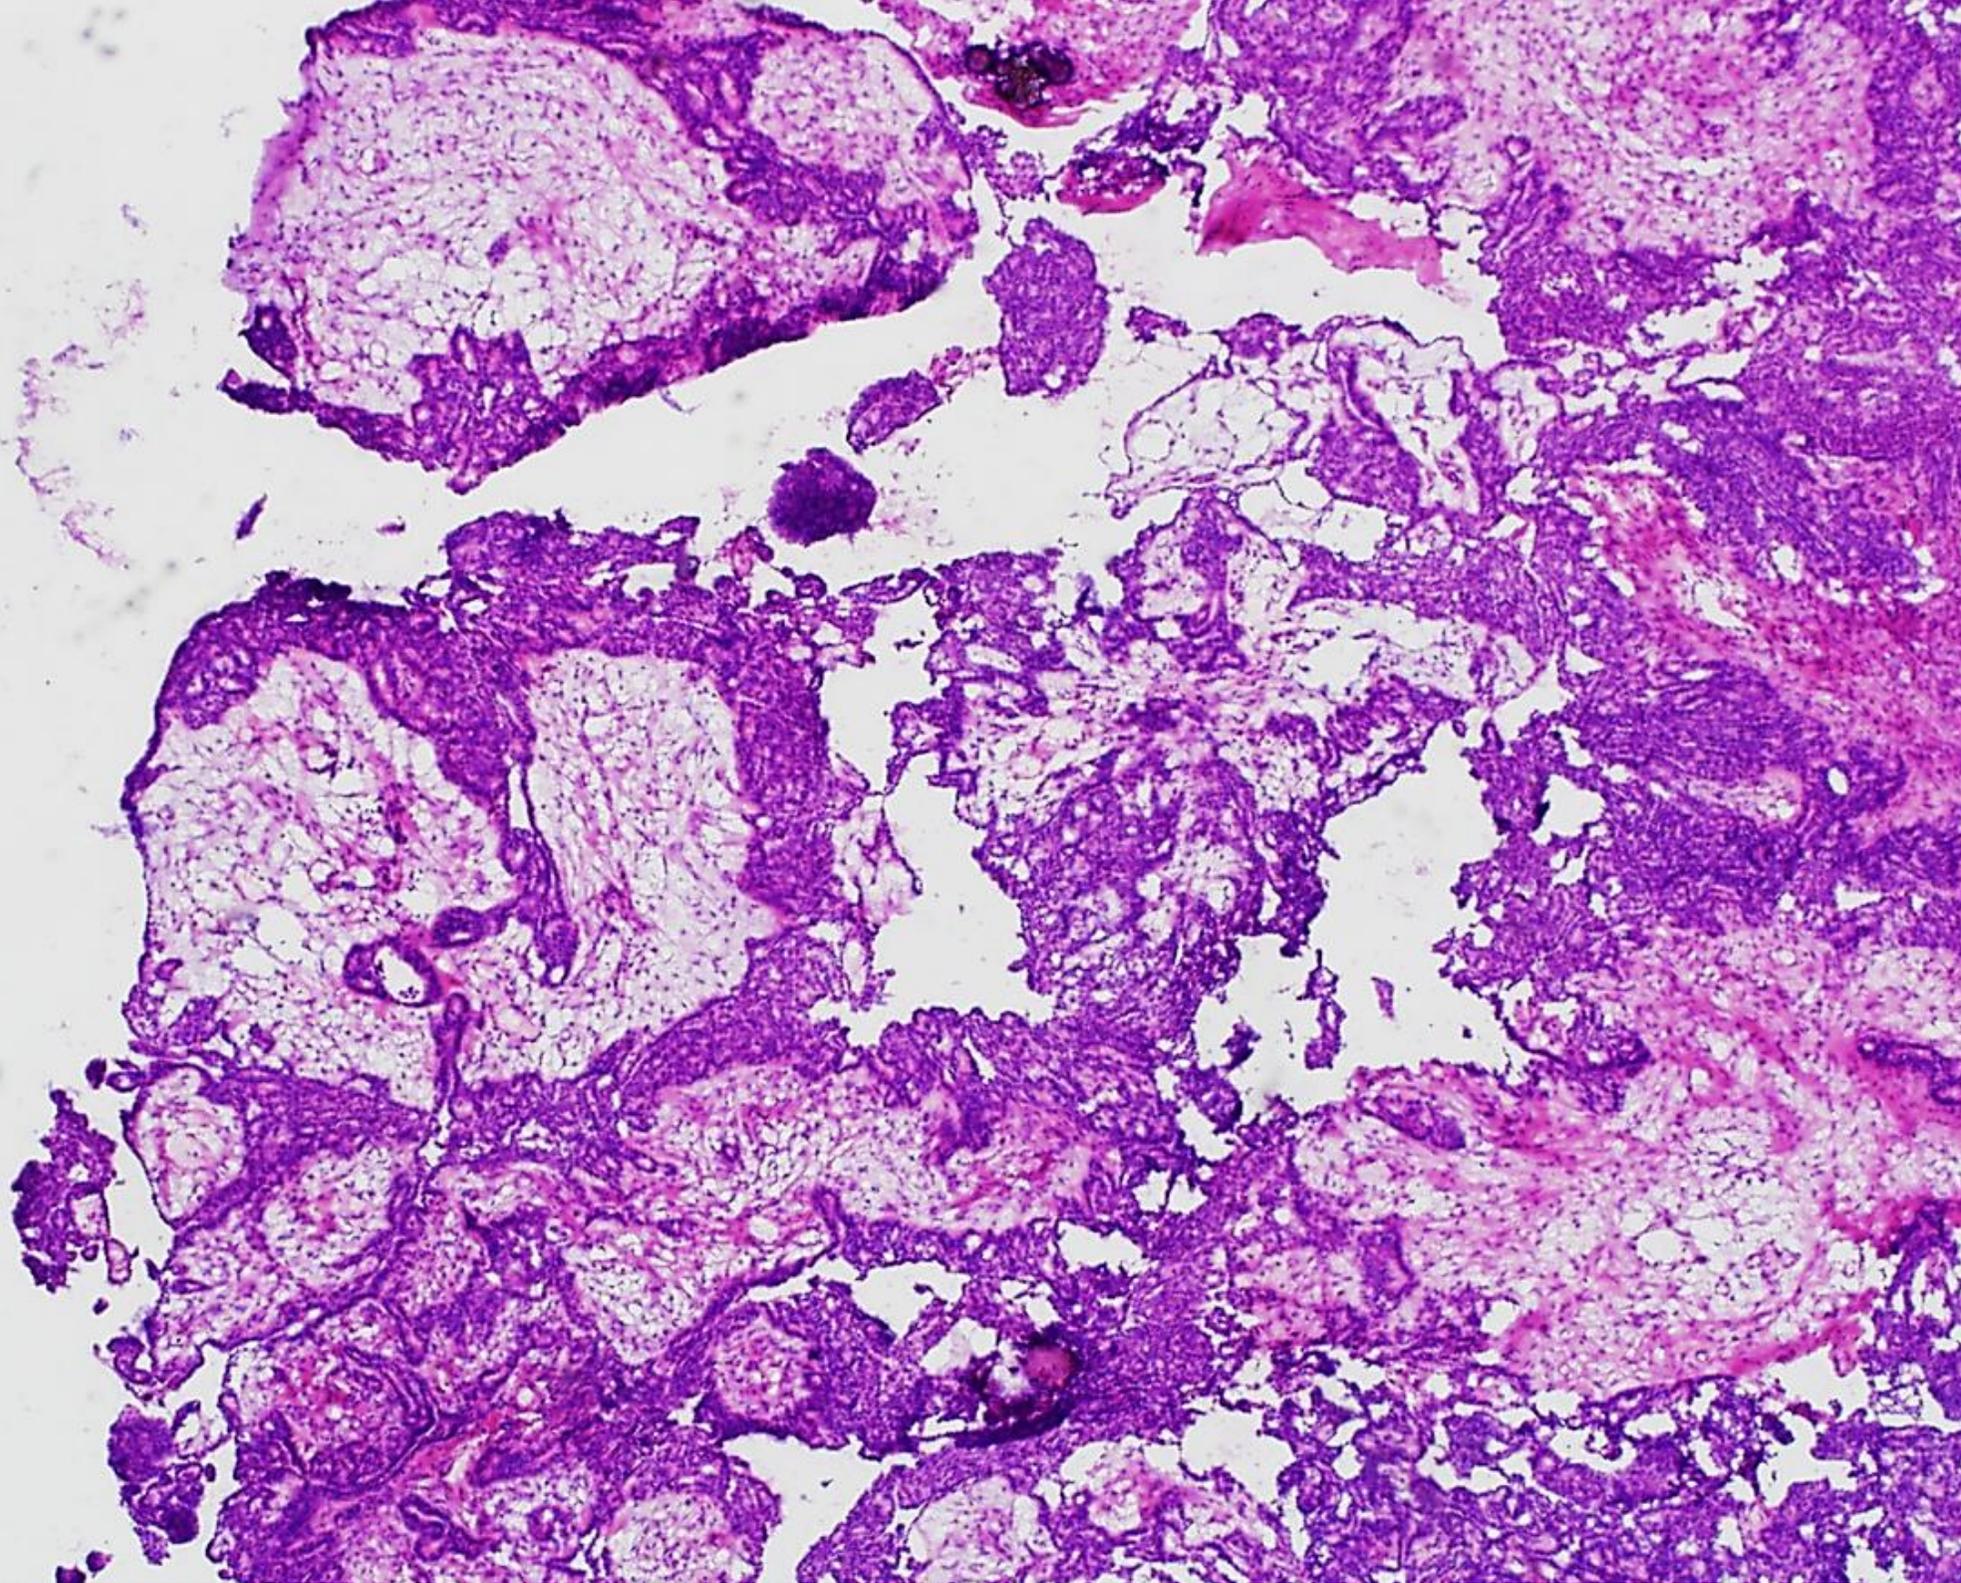

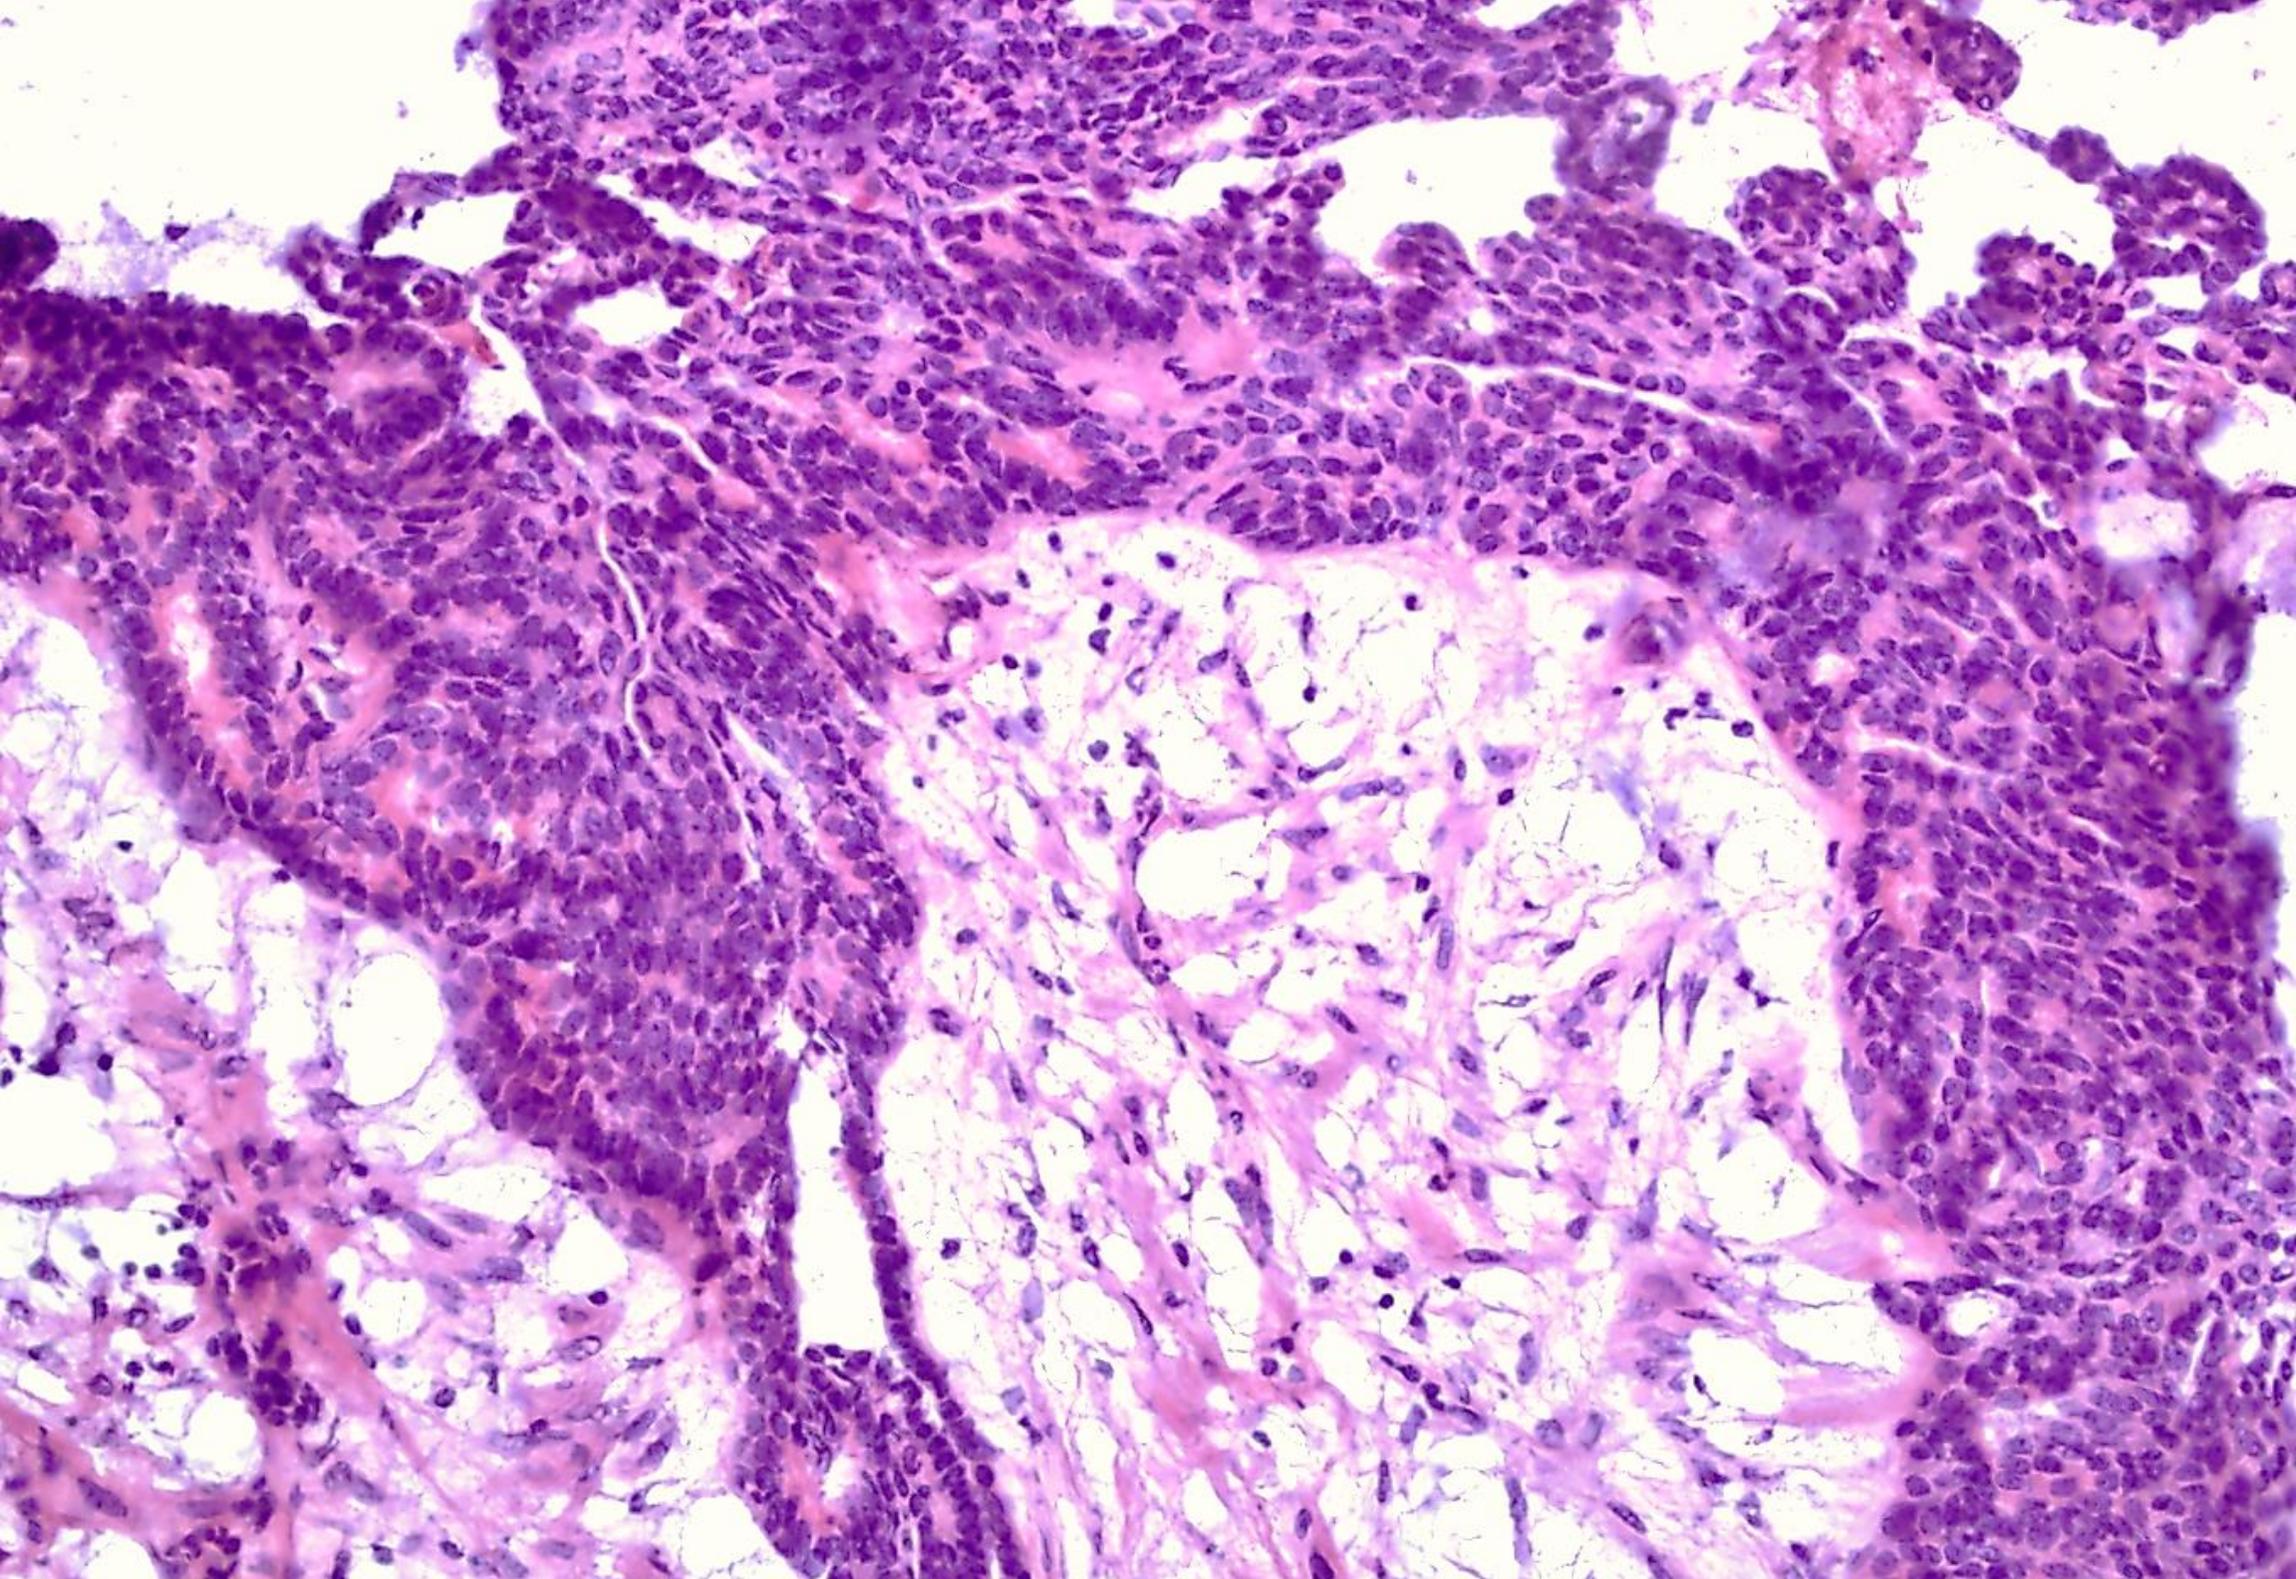

Serous borderline tumor/atypical proliferative serous tumor

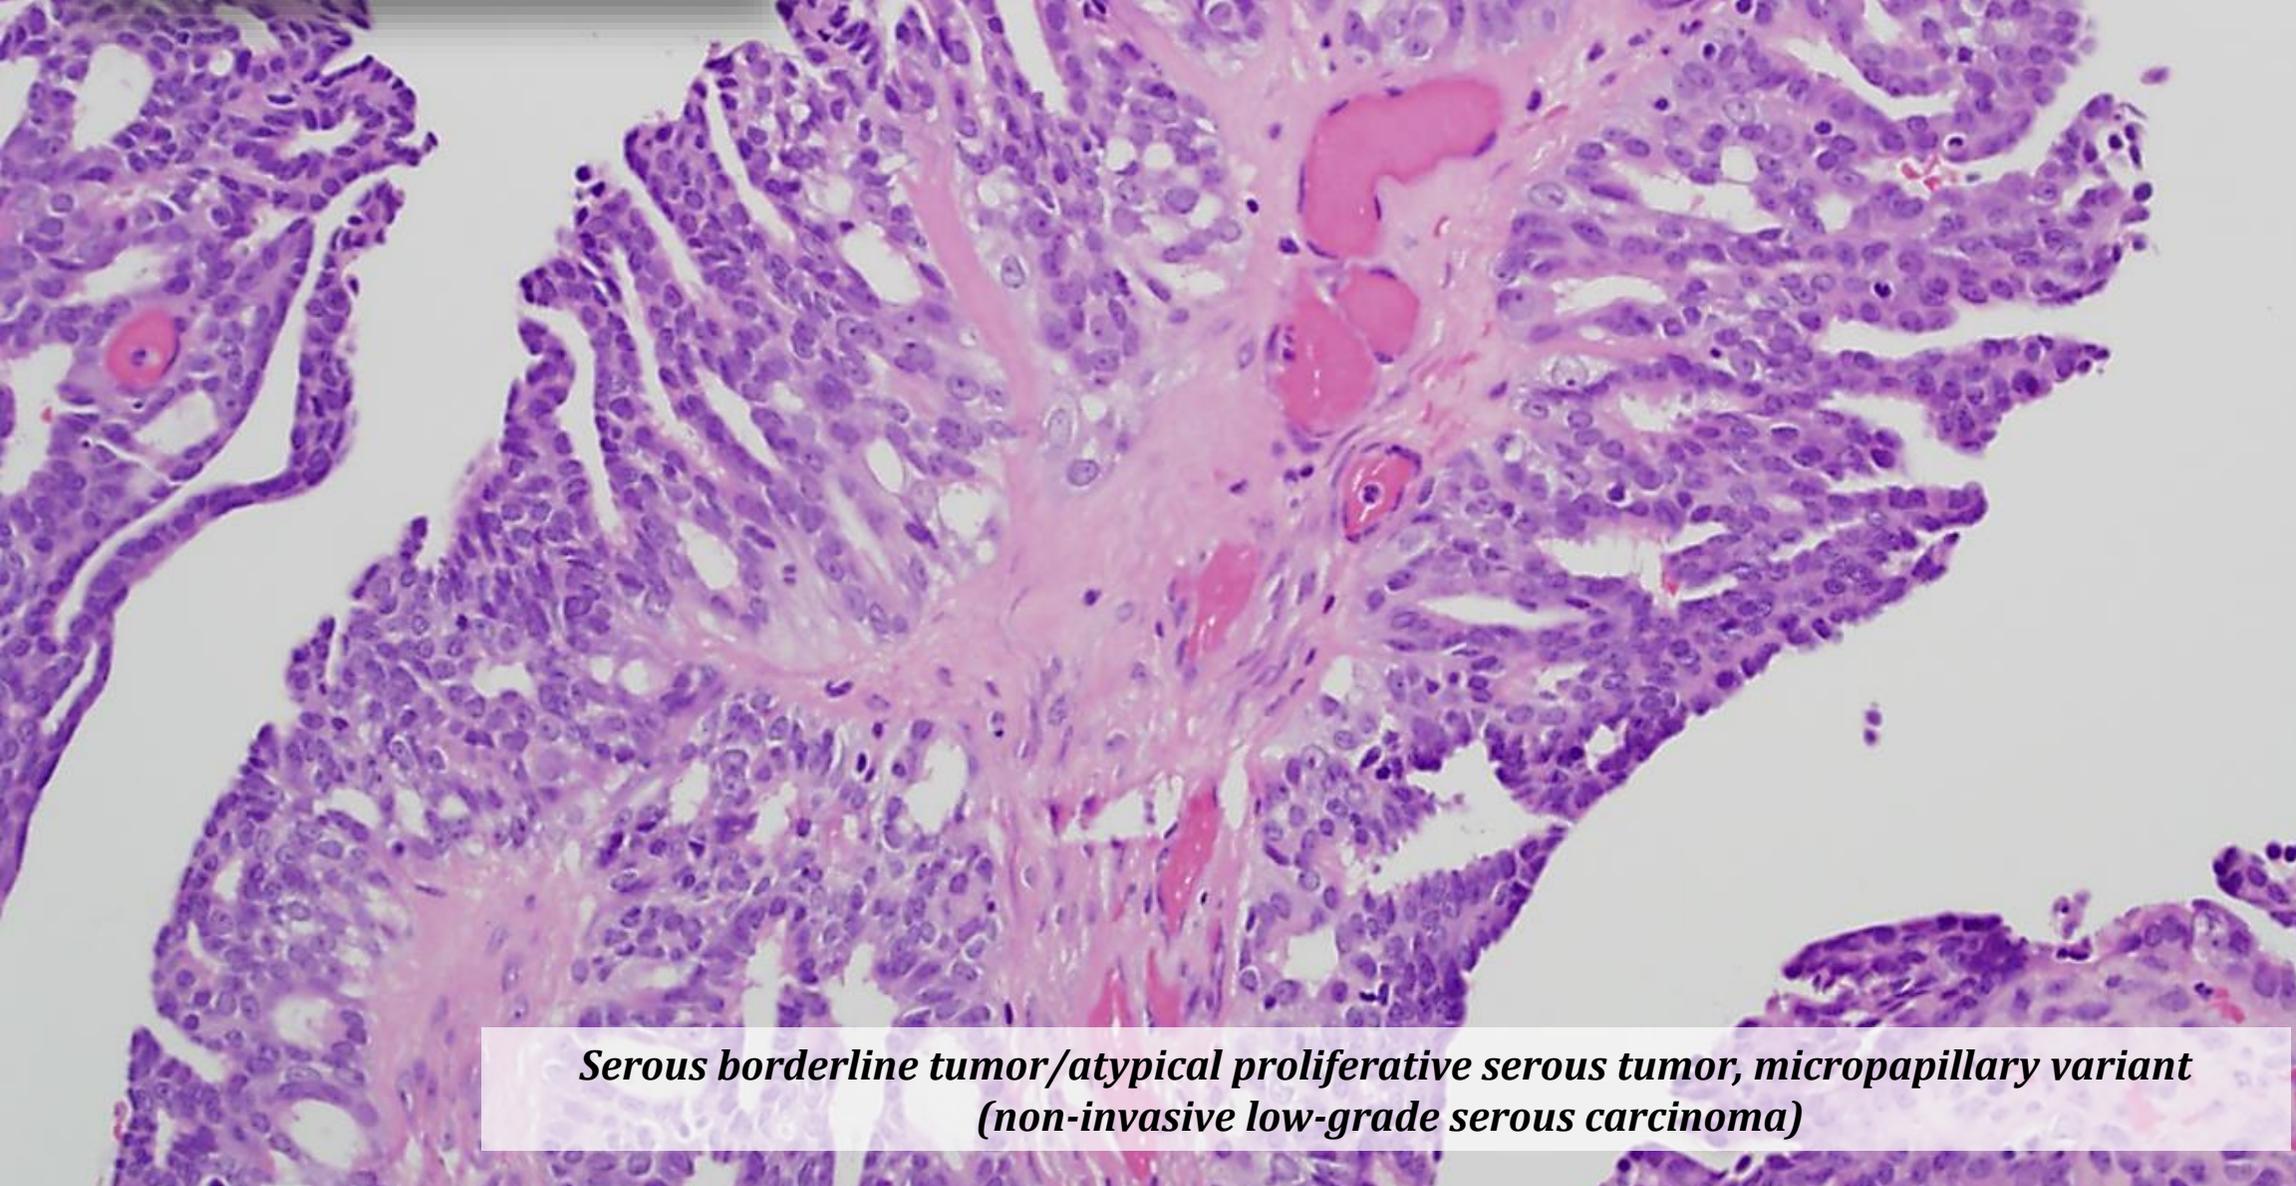

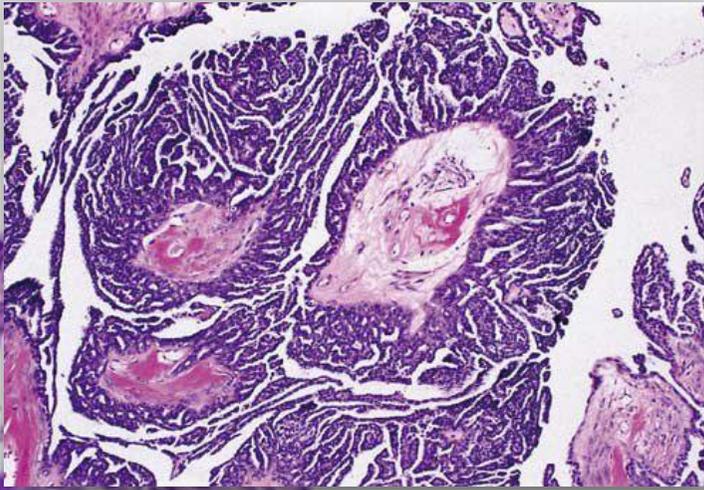

Serous borderline tumor/atypical proliferative serous tumor

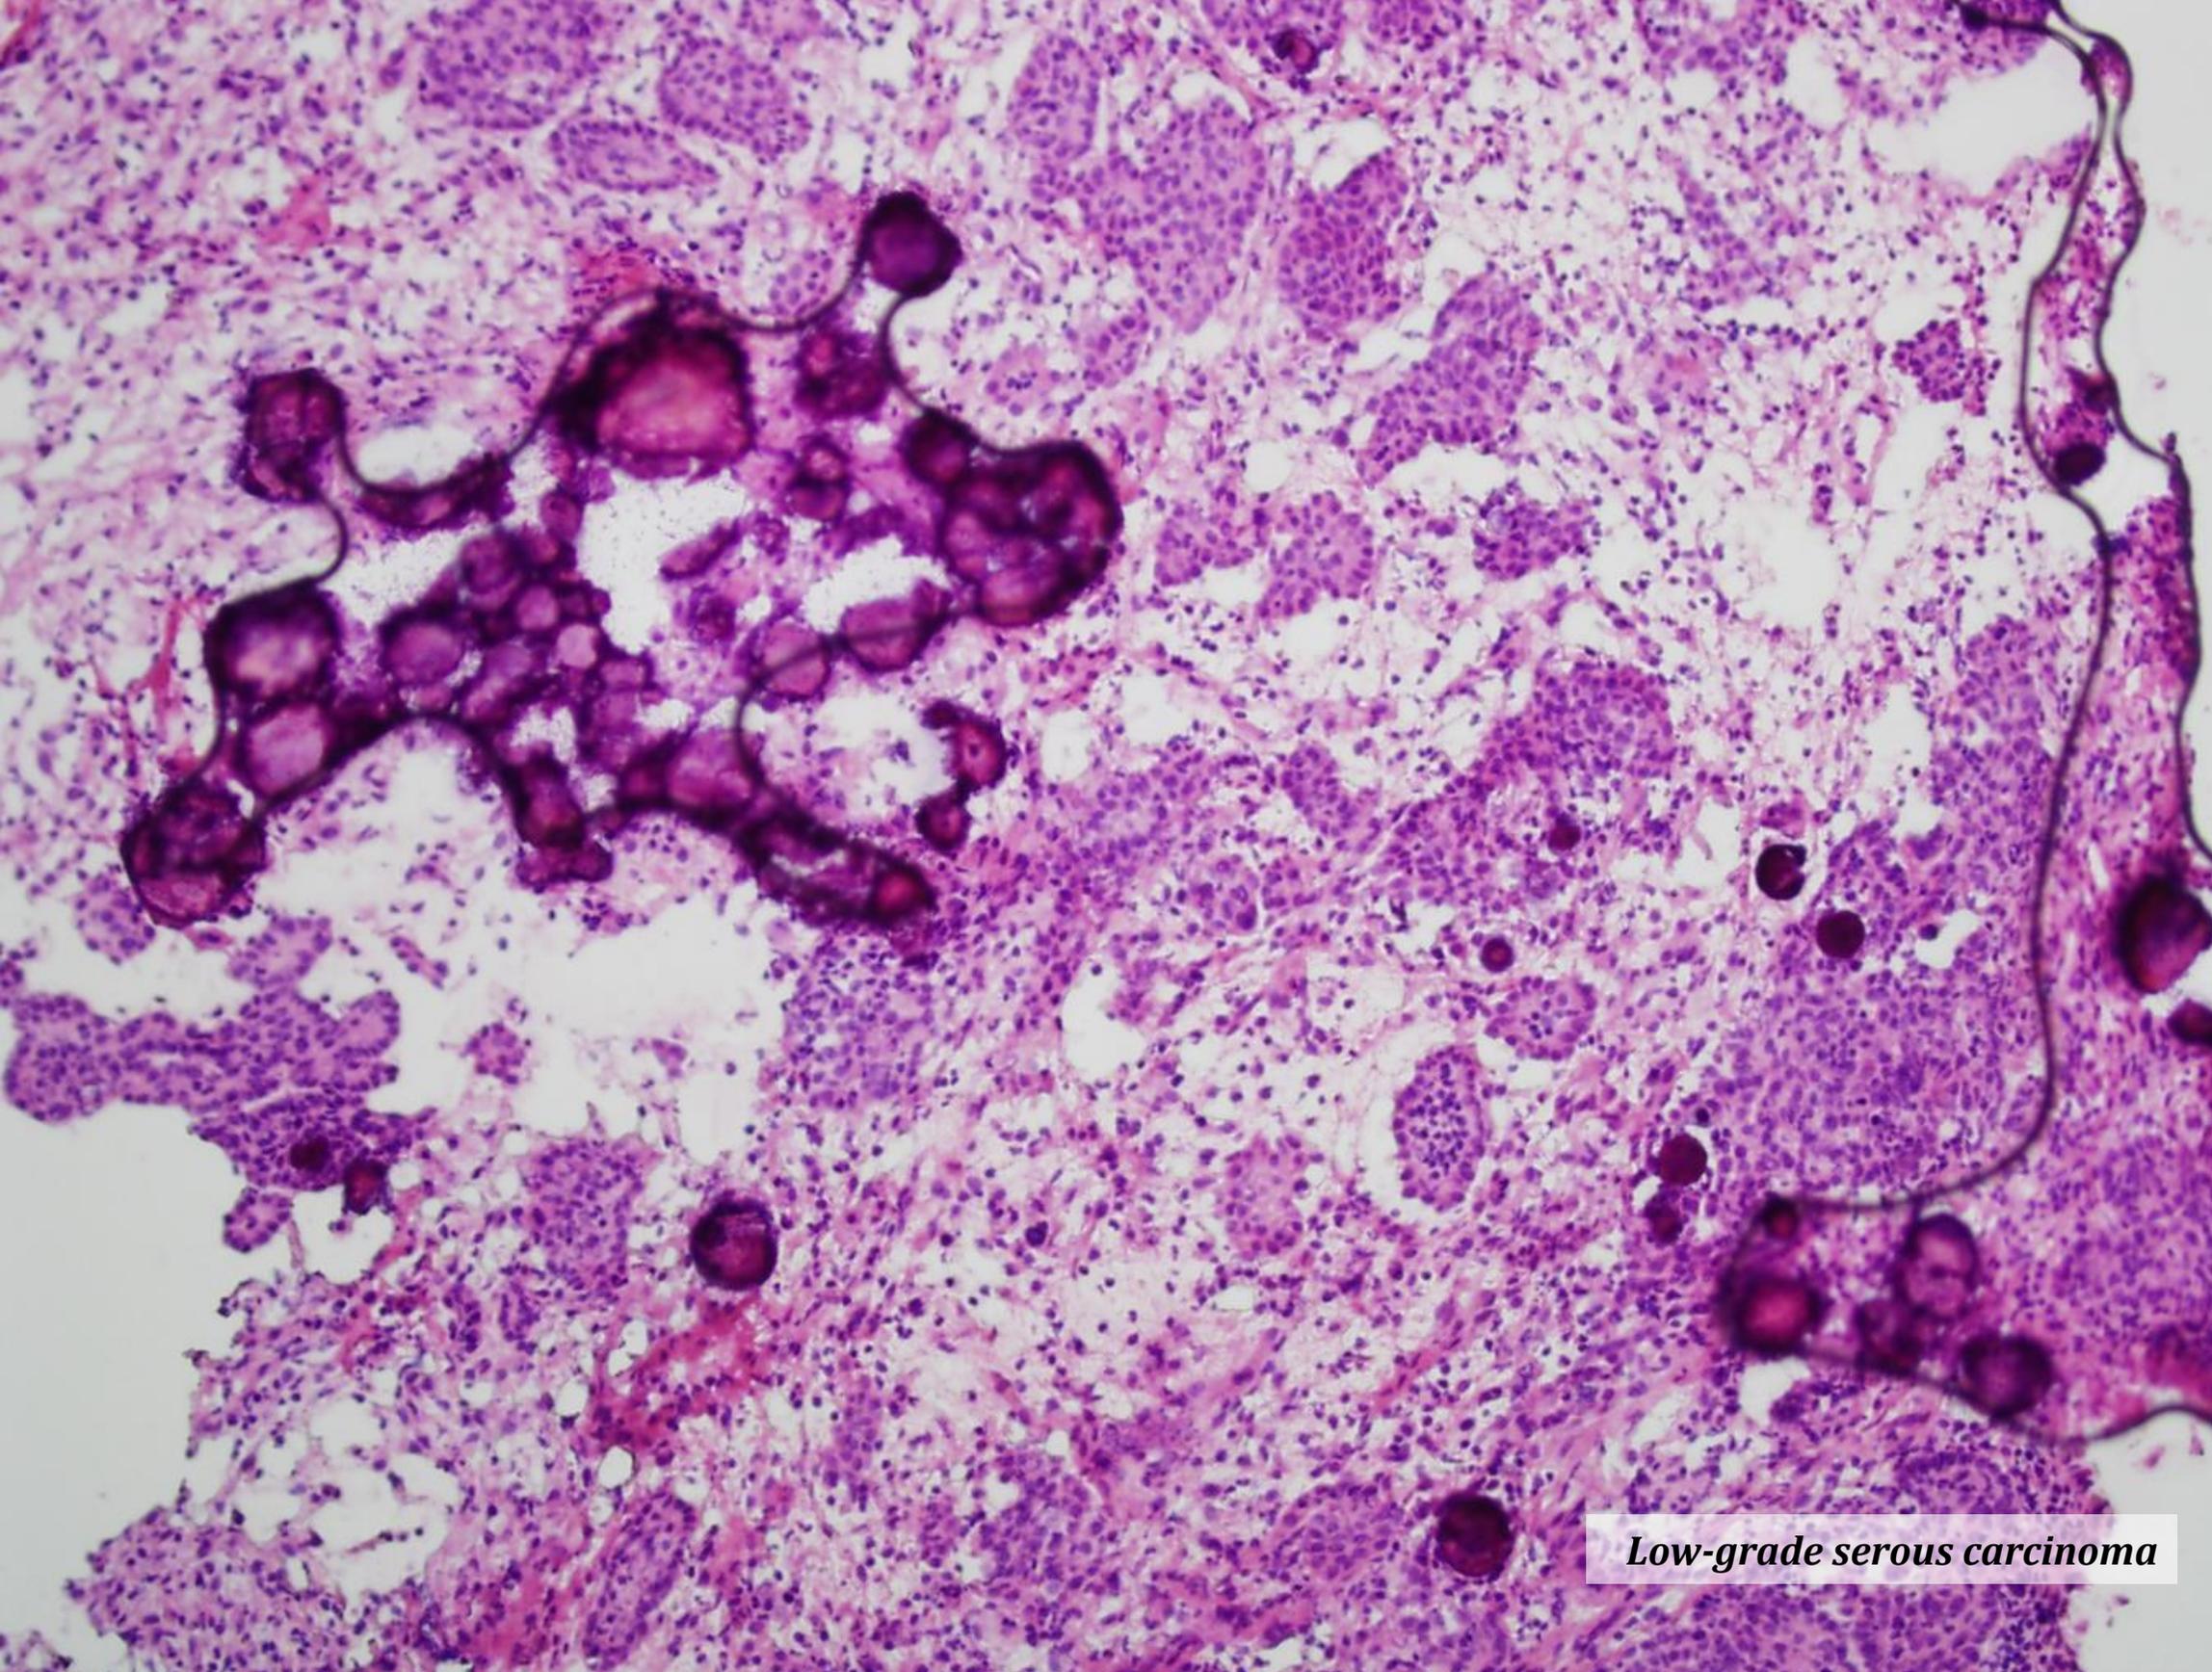

*Serous borderline tumor/atypical proliferative serous tumor, micropapillary variant
(non-invasive low-grade serous carcinoma)*

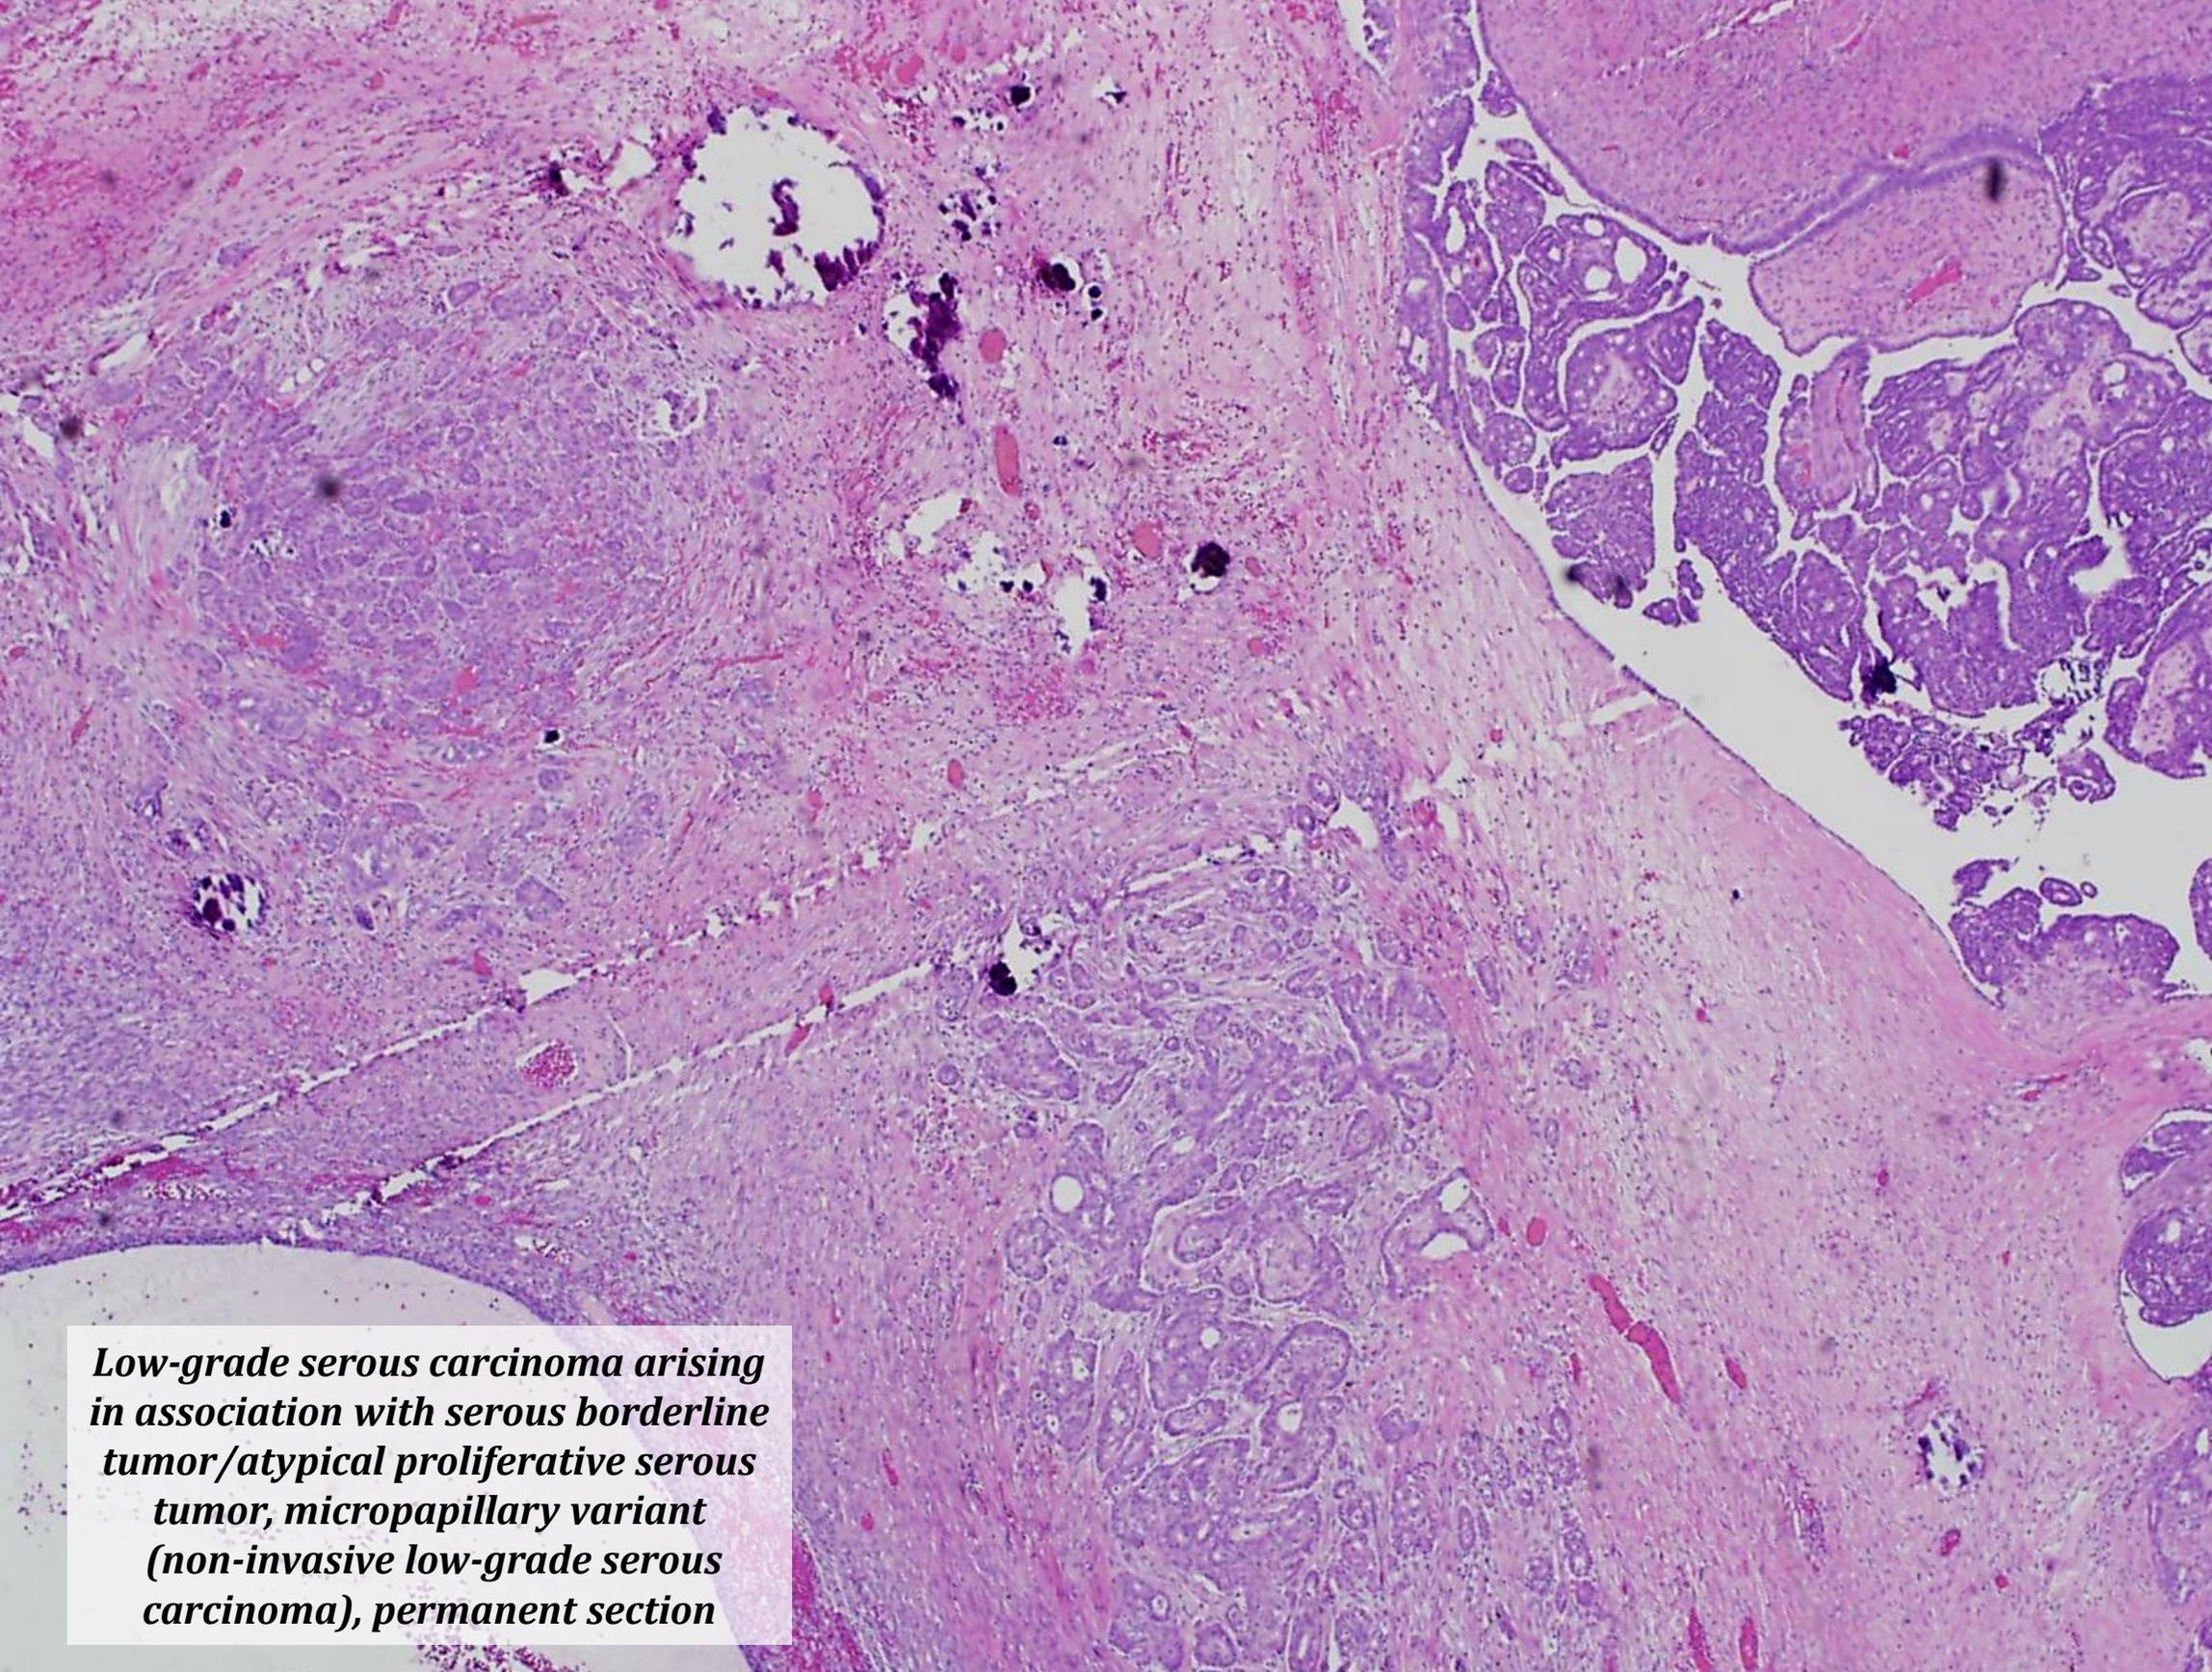

*Serous borderline tumor/atypical proliferative serous tumor, micropapillary variant
(non-invasive low-grade serous carcinoma)*

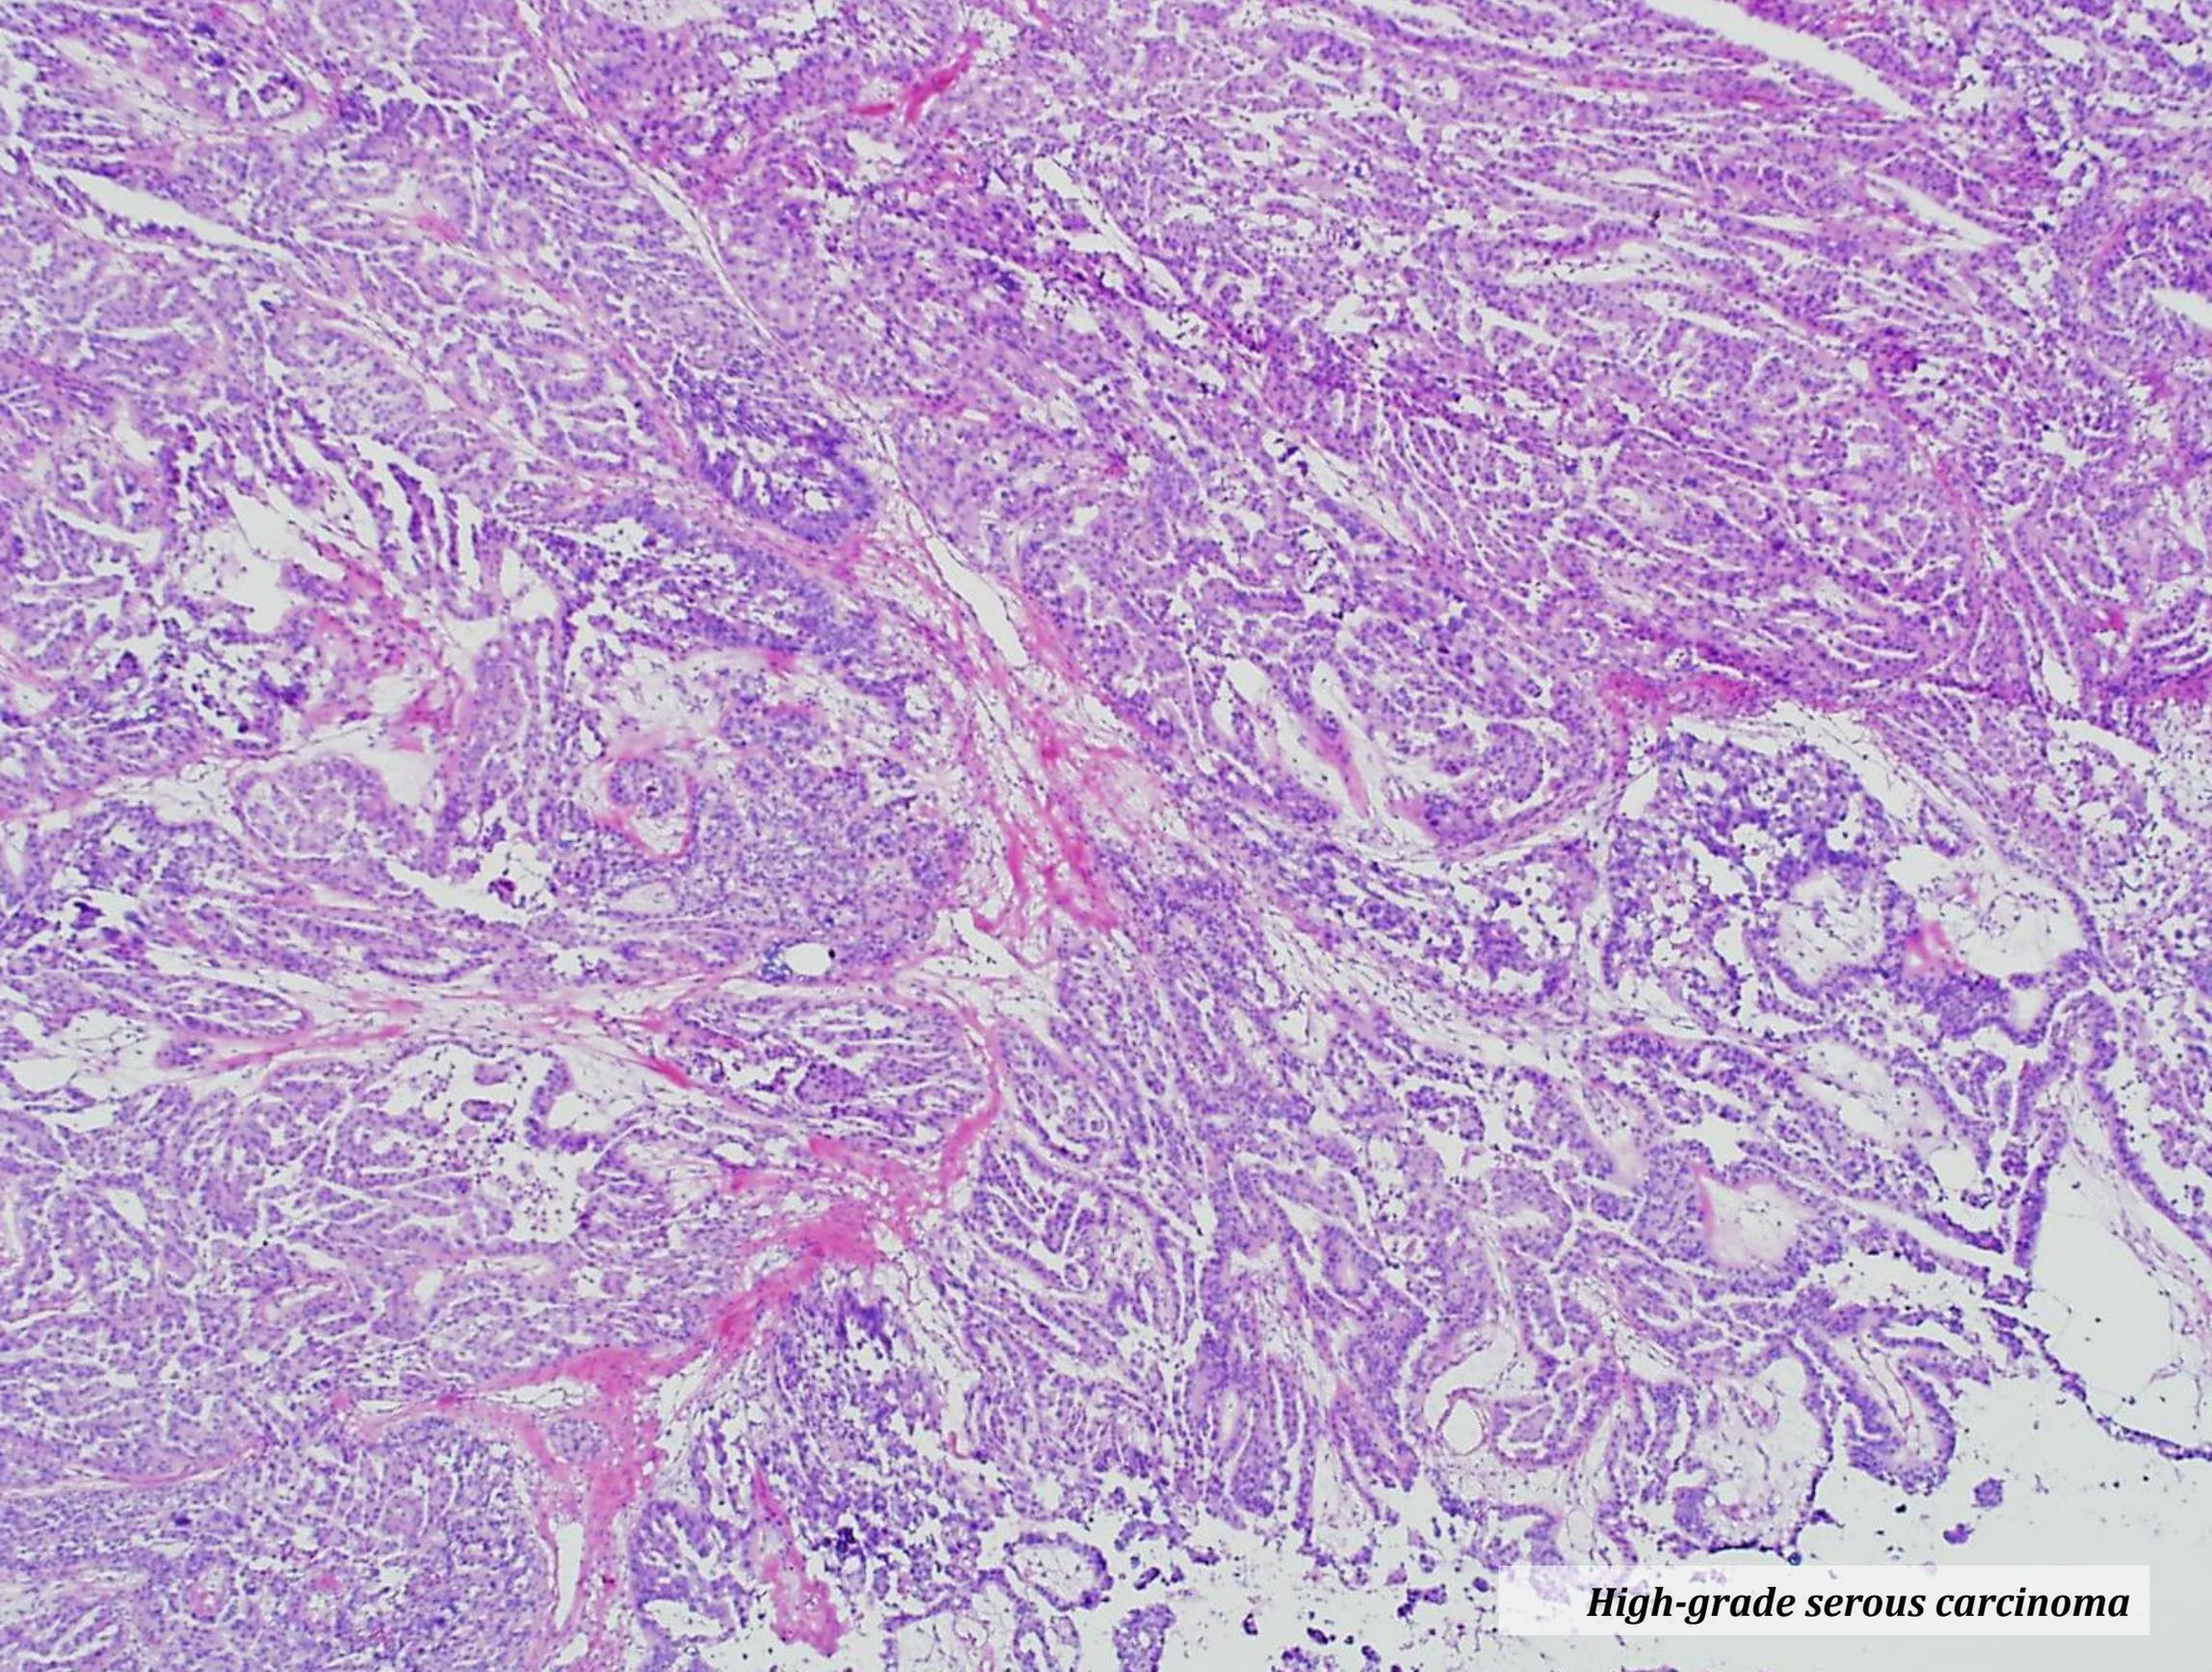

*Serous borderline tumor/atypical proliferative serous tumor, micropapillary variant
(non-invasive low-grade serous carcinoma)*

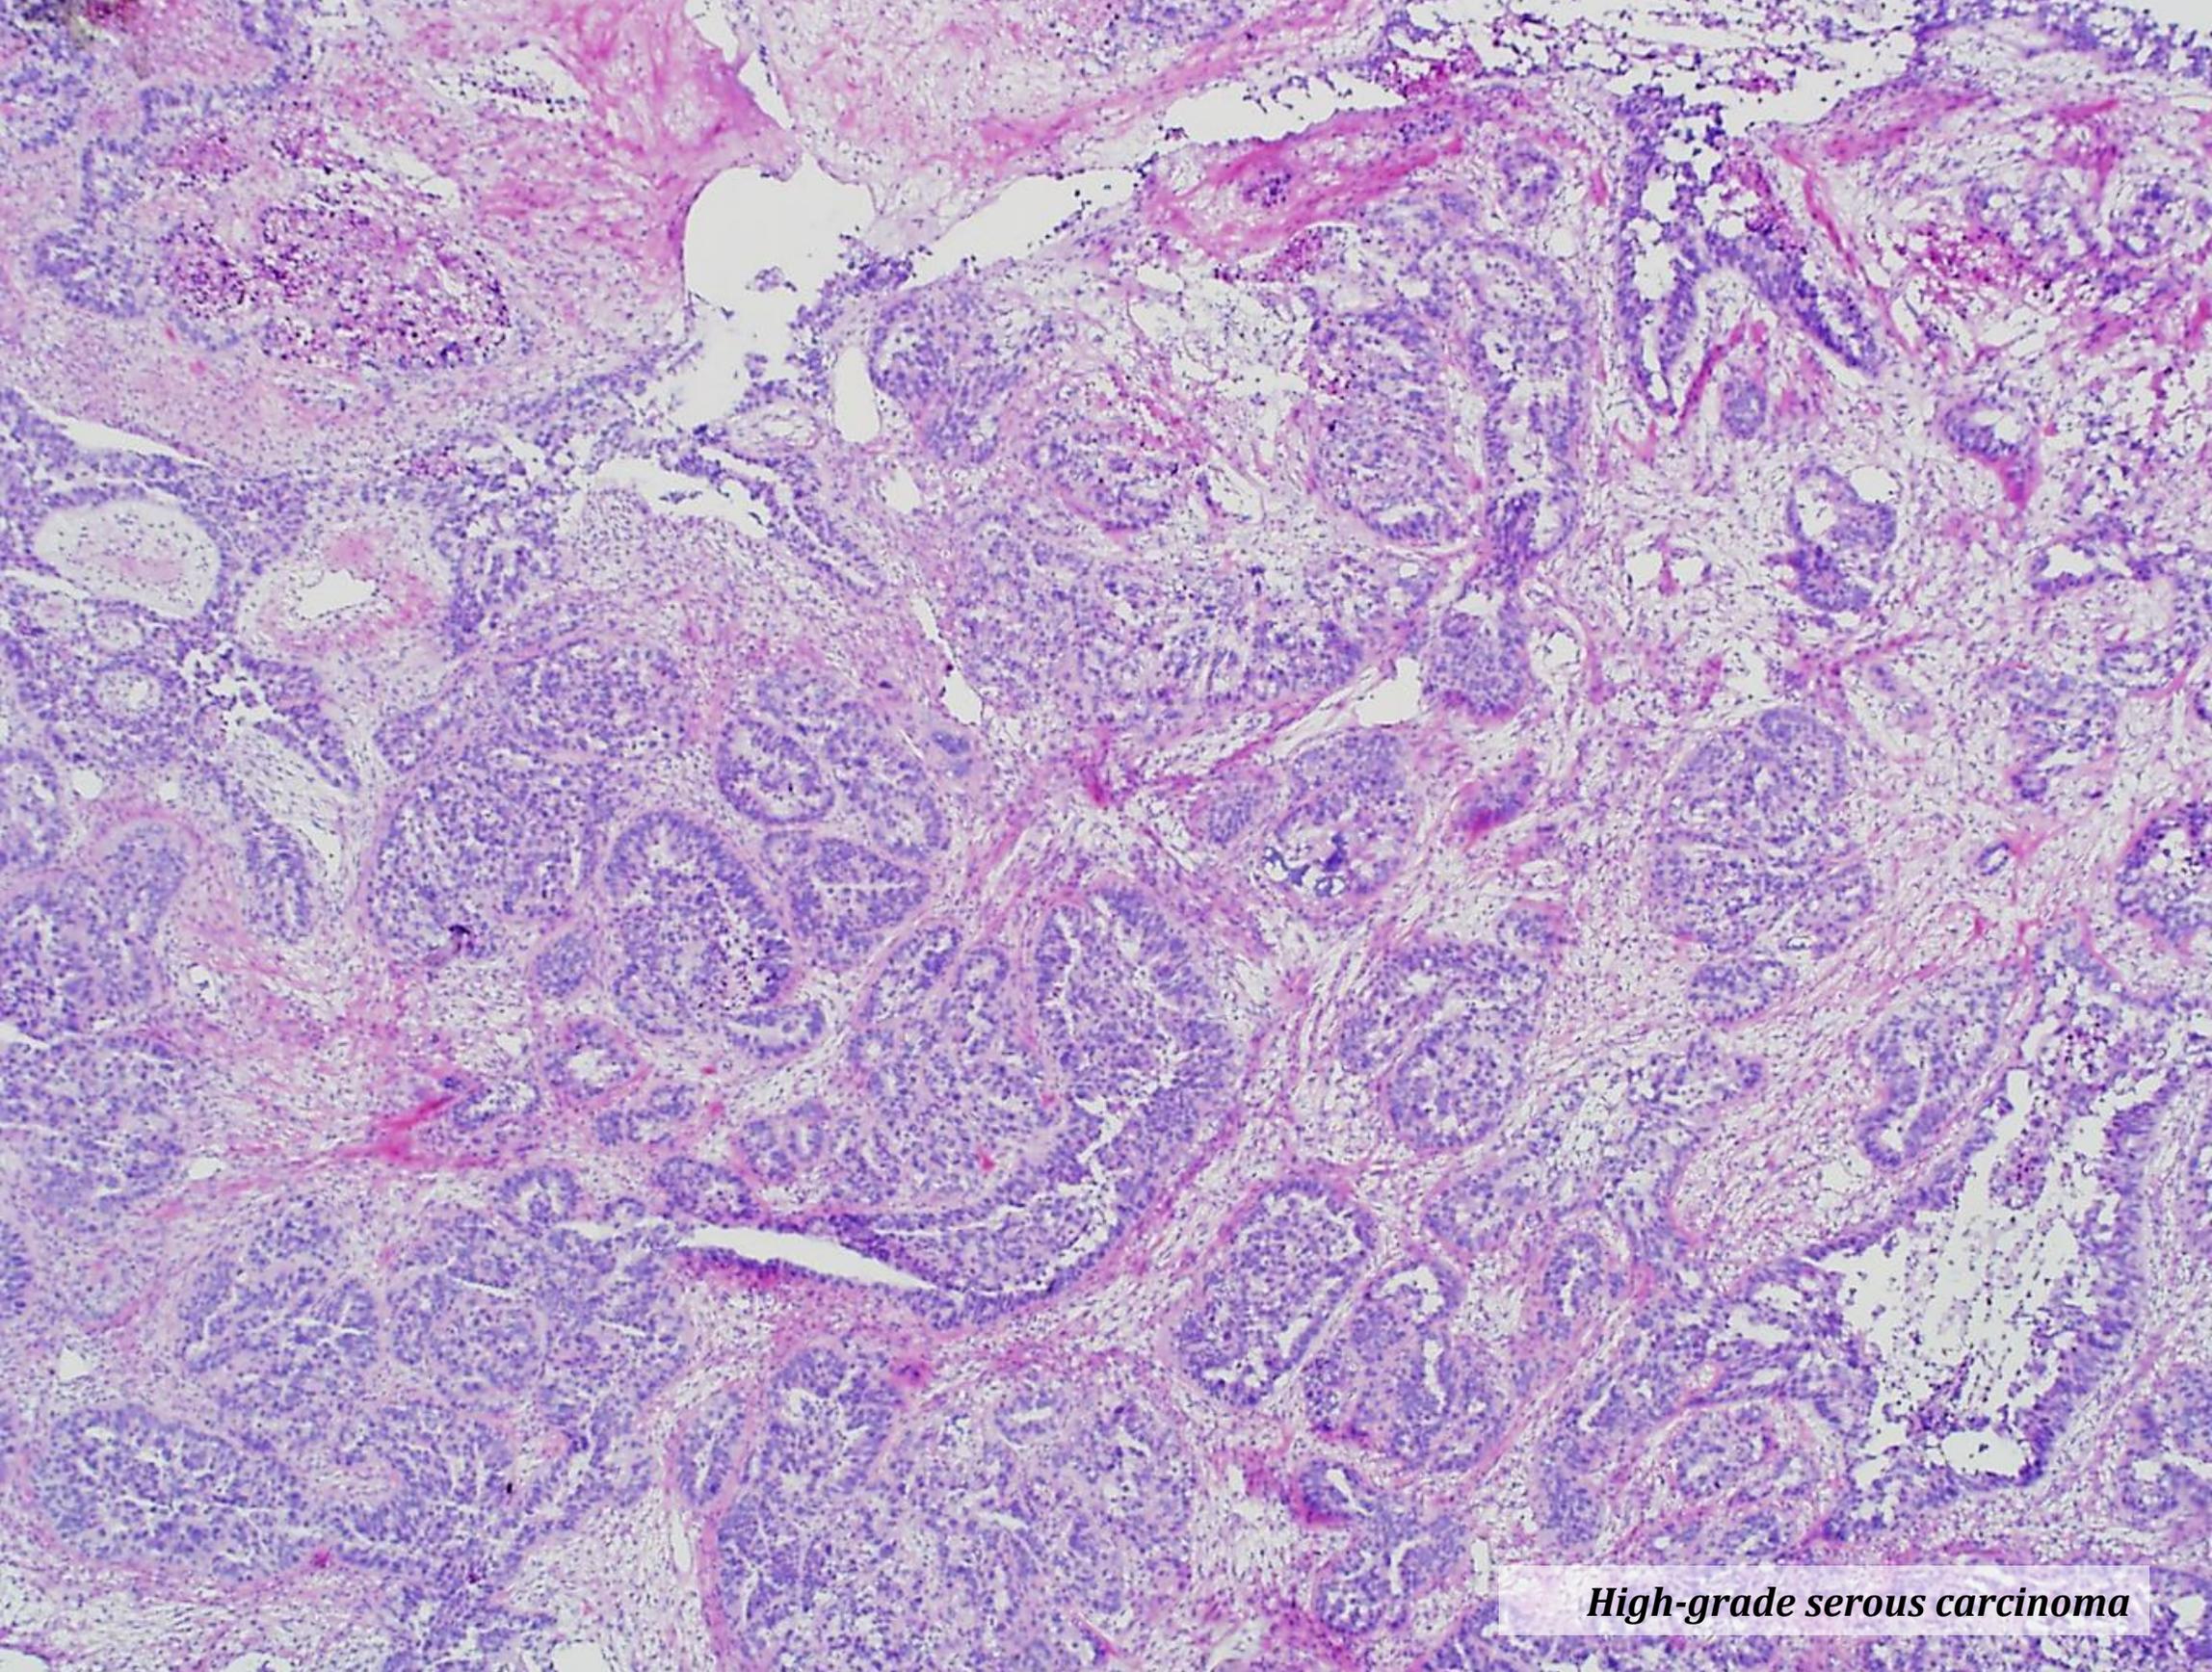

Low-grade serous carcinoma

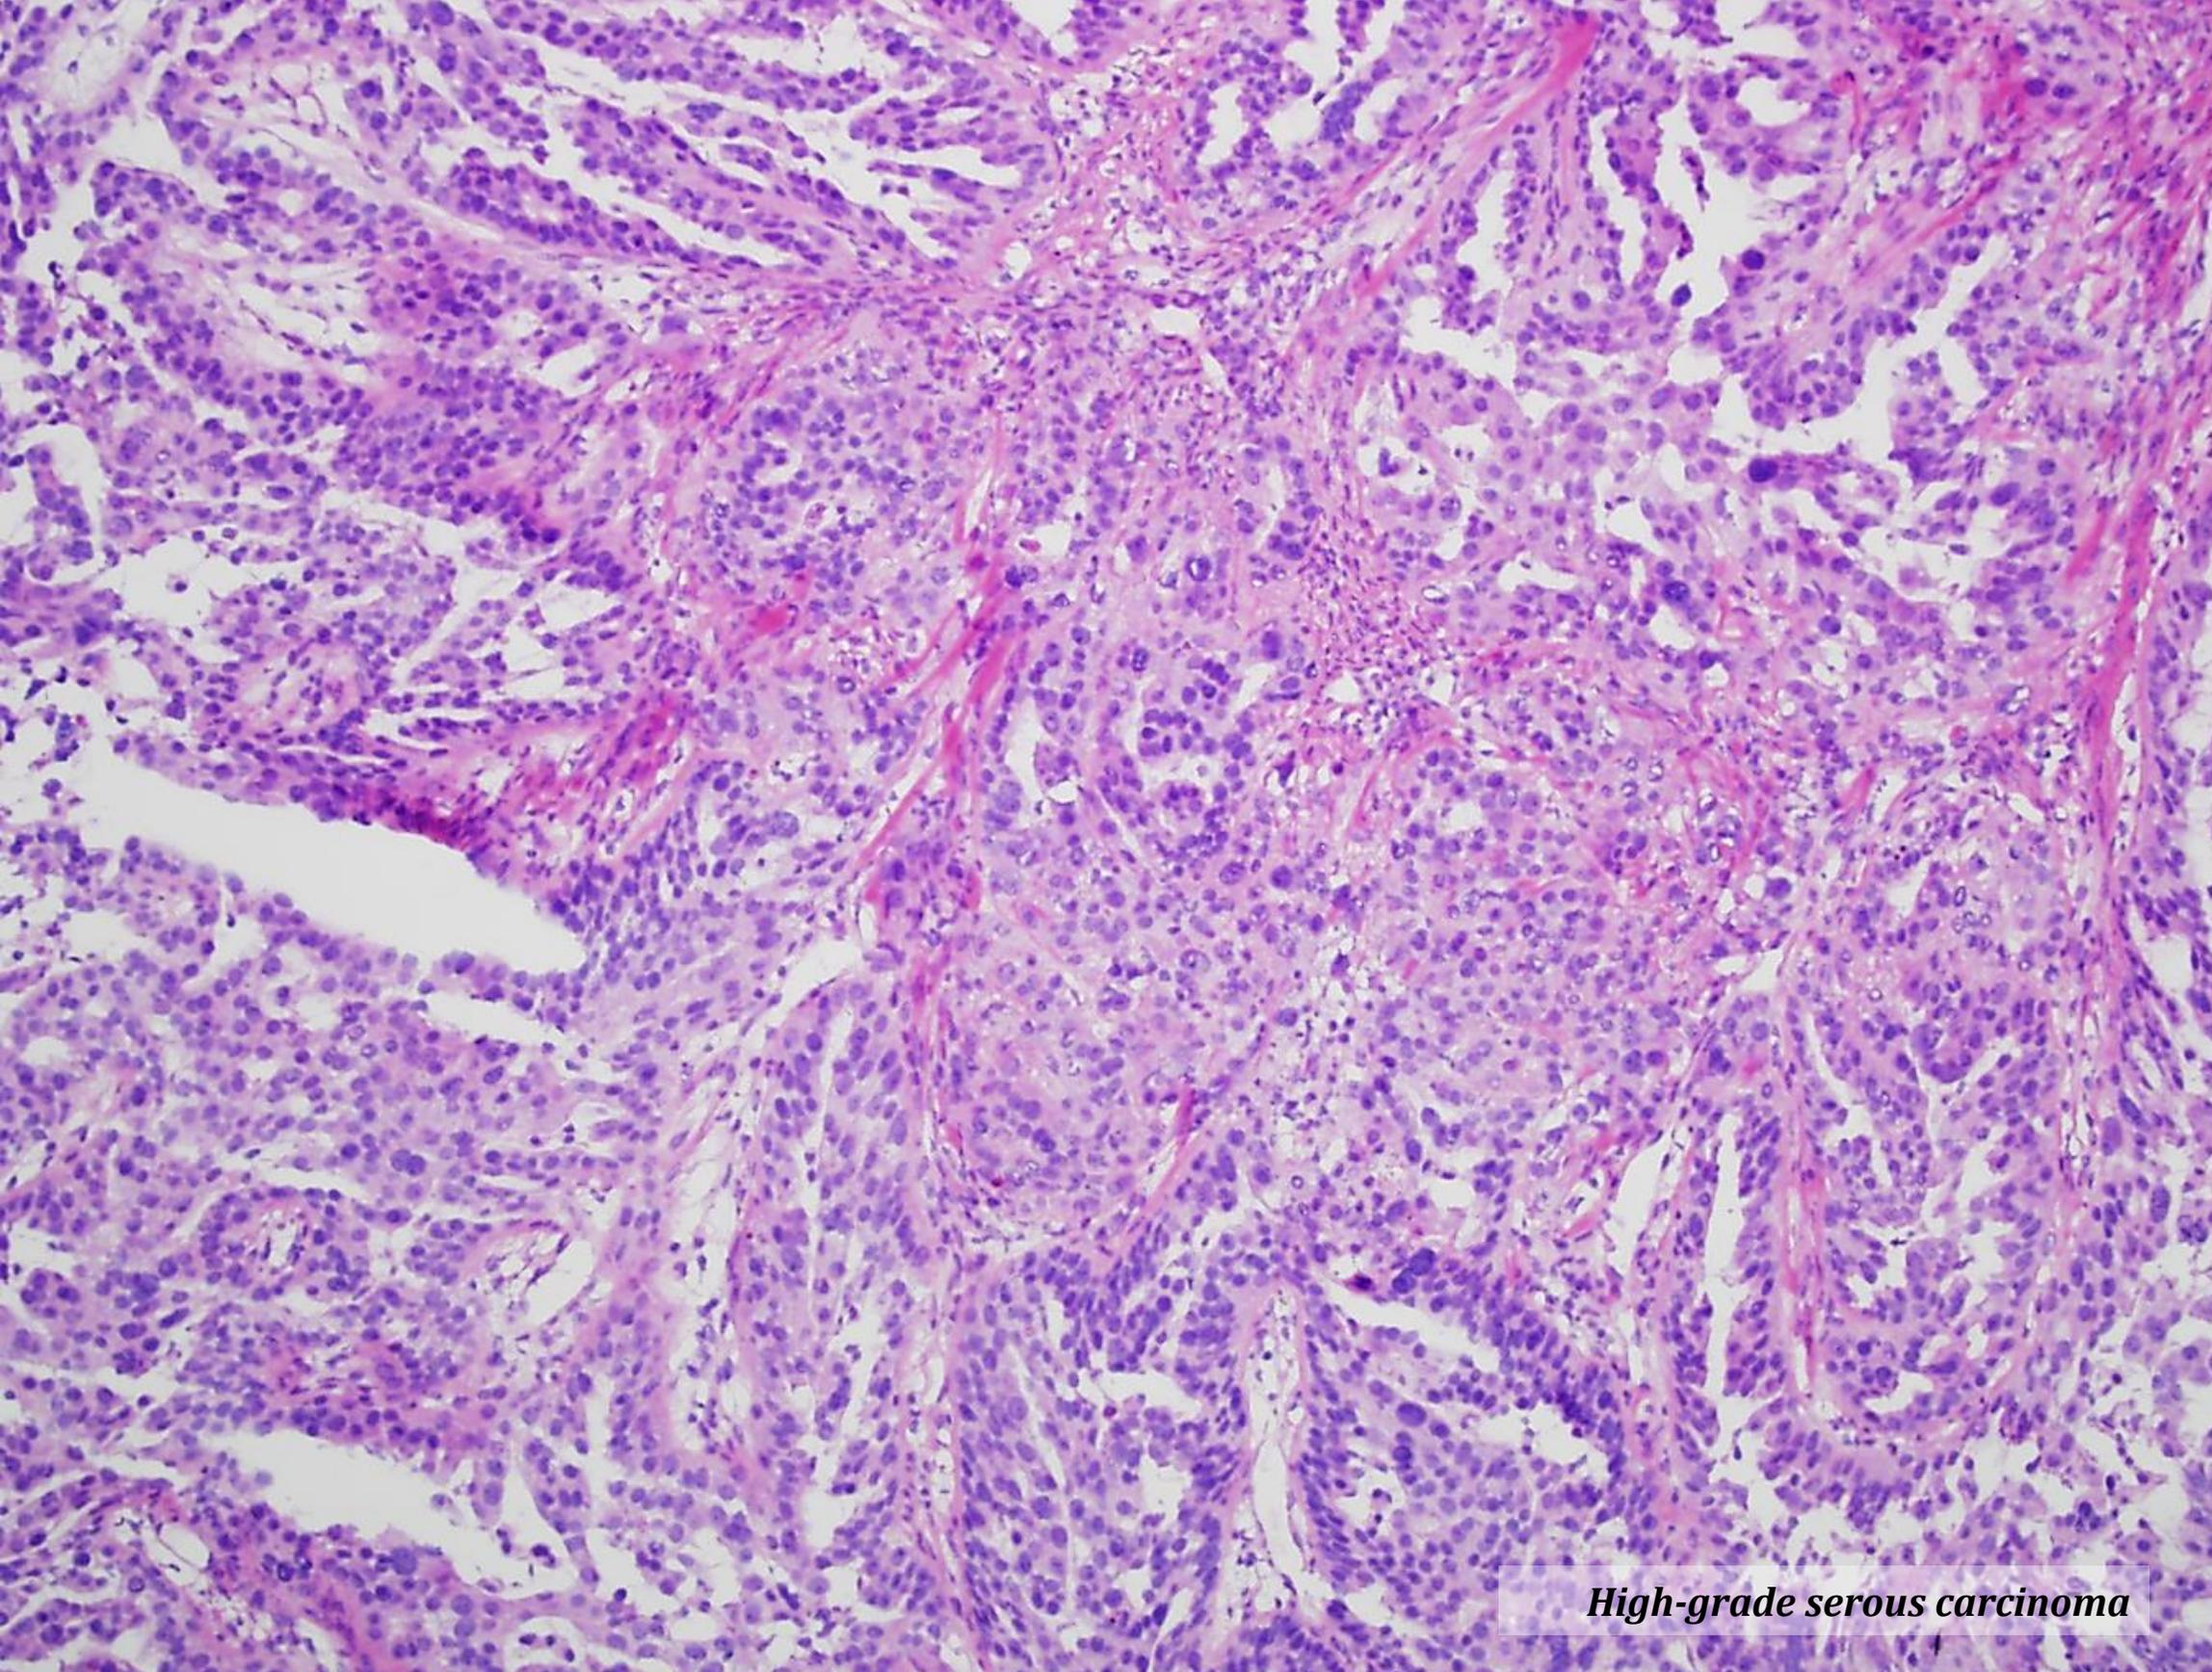

Low-grade serous carcinoma arising in association with serous borderline tumor/atypical proliferative serous tumor, micropapillary variant (non-invasive low-grade serous carcinoma), permanent section

High-grade serous carcinoma

High-grade serous carcinoma

High-grade serous carcinoma

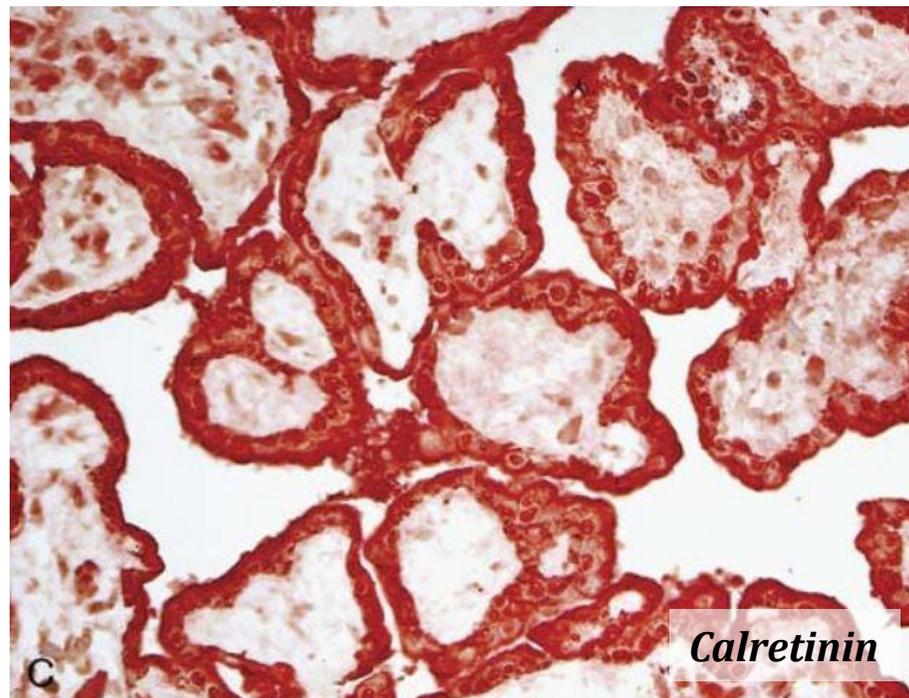

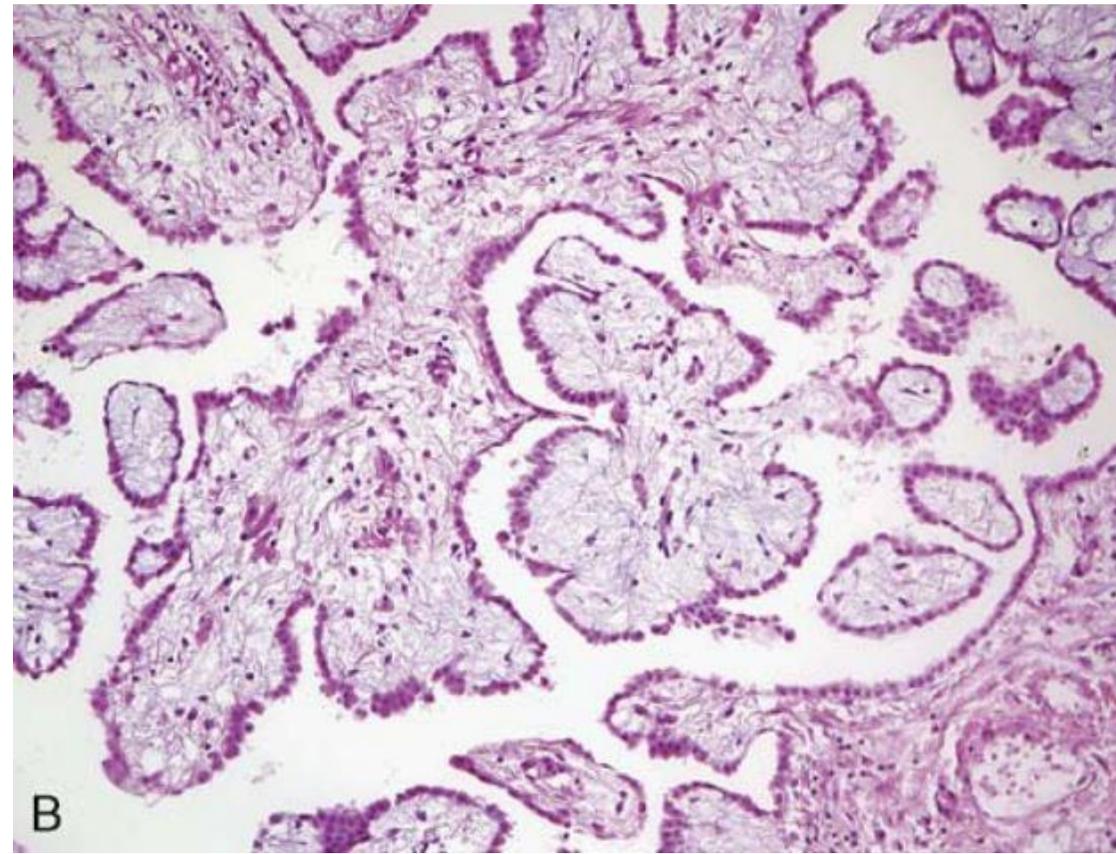

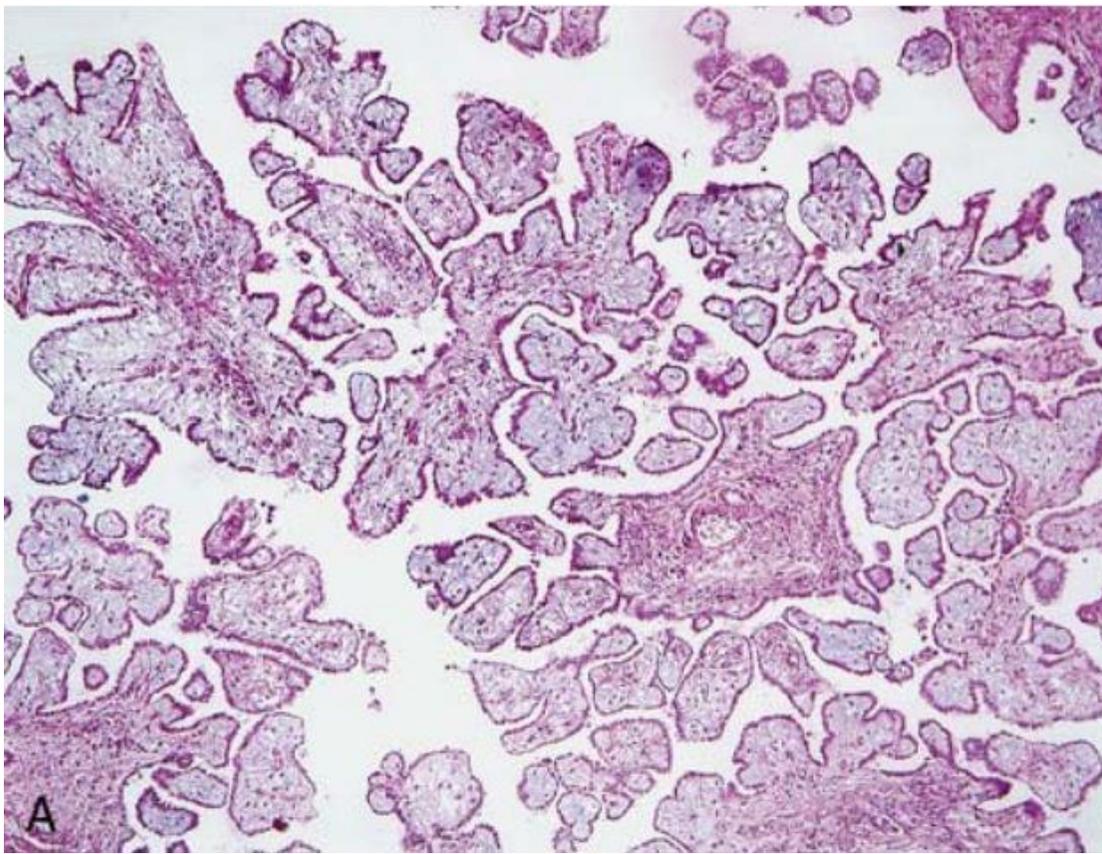

Pitfalls #1 and #2

SCENARIO:

Woman with a complex ovarian mass is taken to surgery for salpingo-oophorectomy and possible staging. The ovary was sent for frozen section analysis and a diagnosis of “at least atypical proliferative (borderline) serous tumor” was rendered. As the surgery progressed, the surgeon sends down what is labeled “peritoneal lesion” for frozen section.

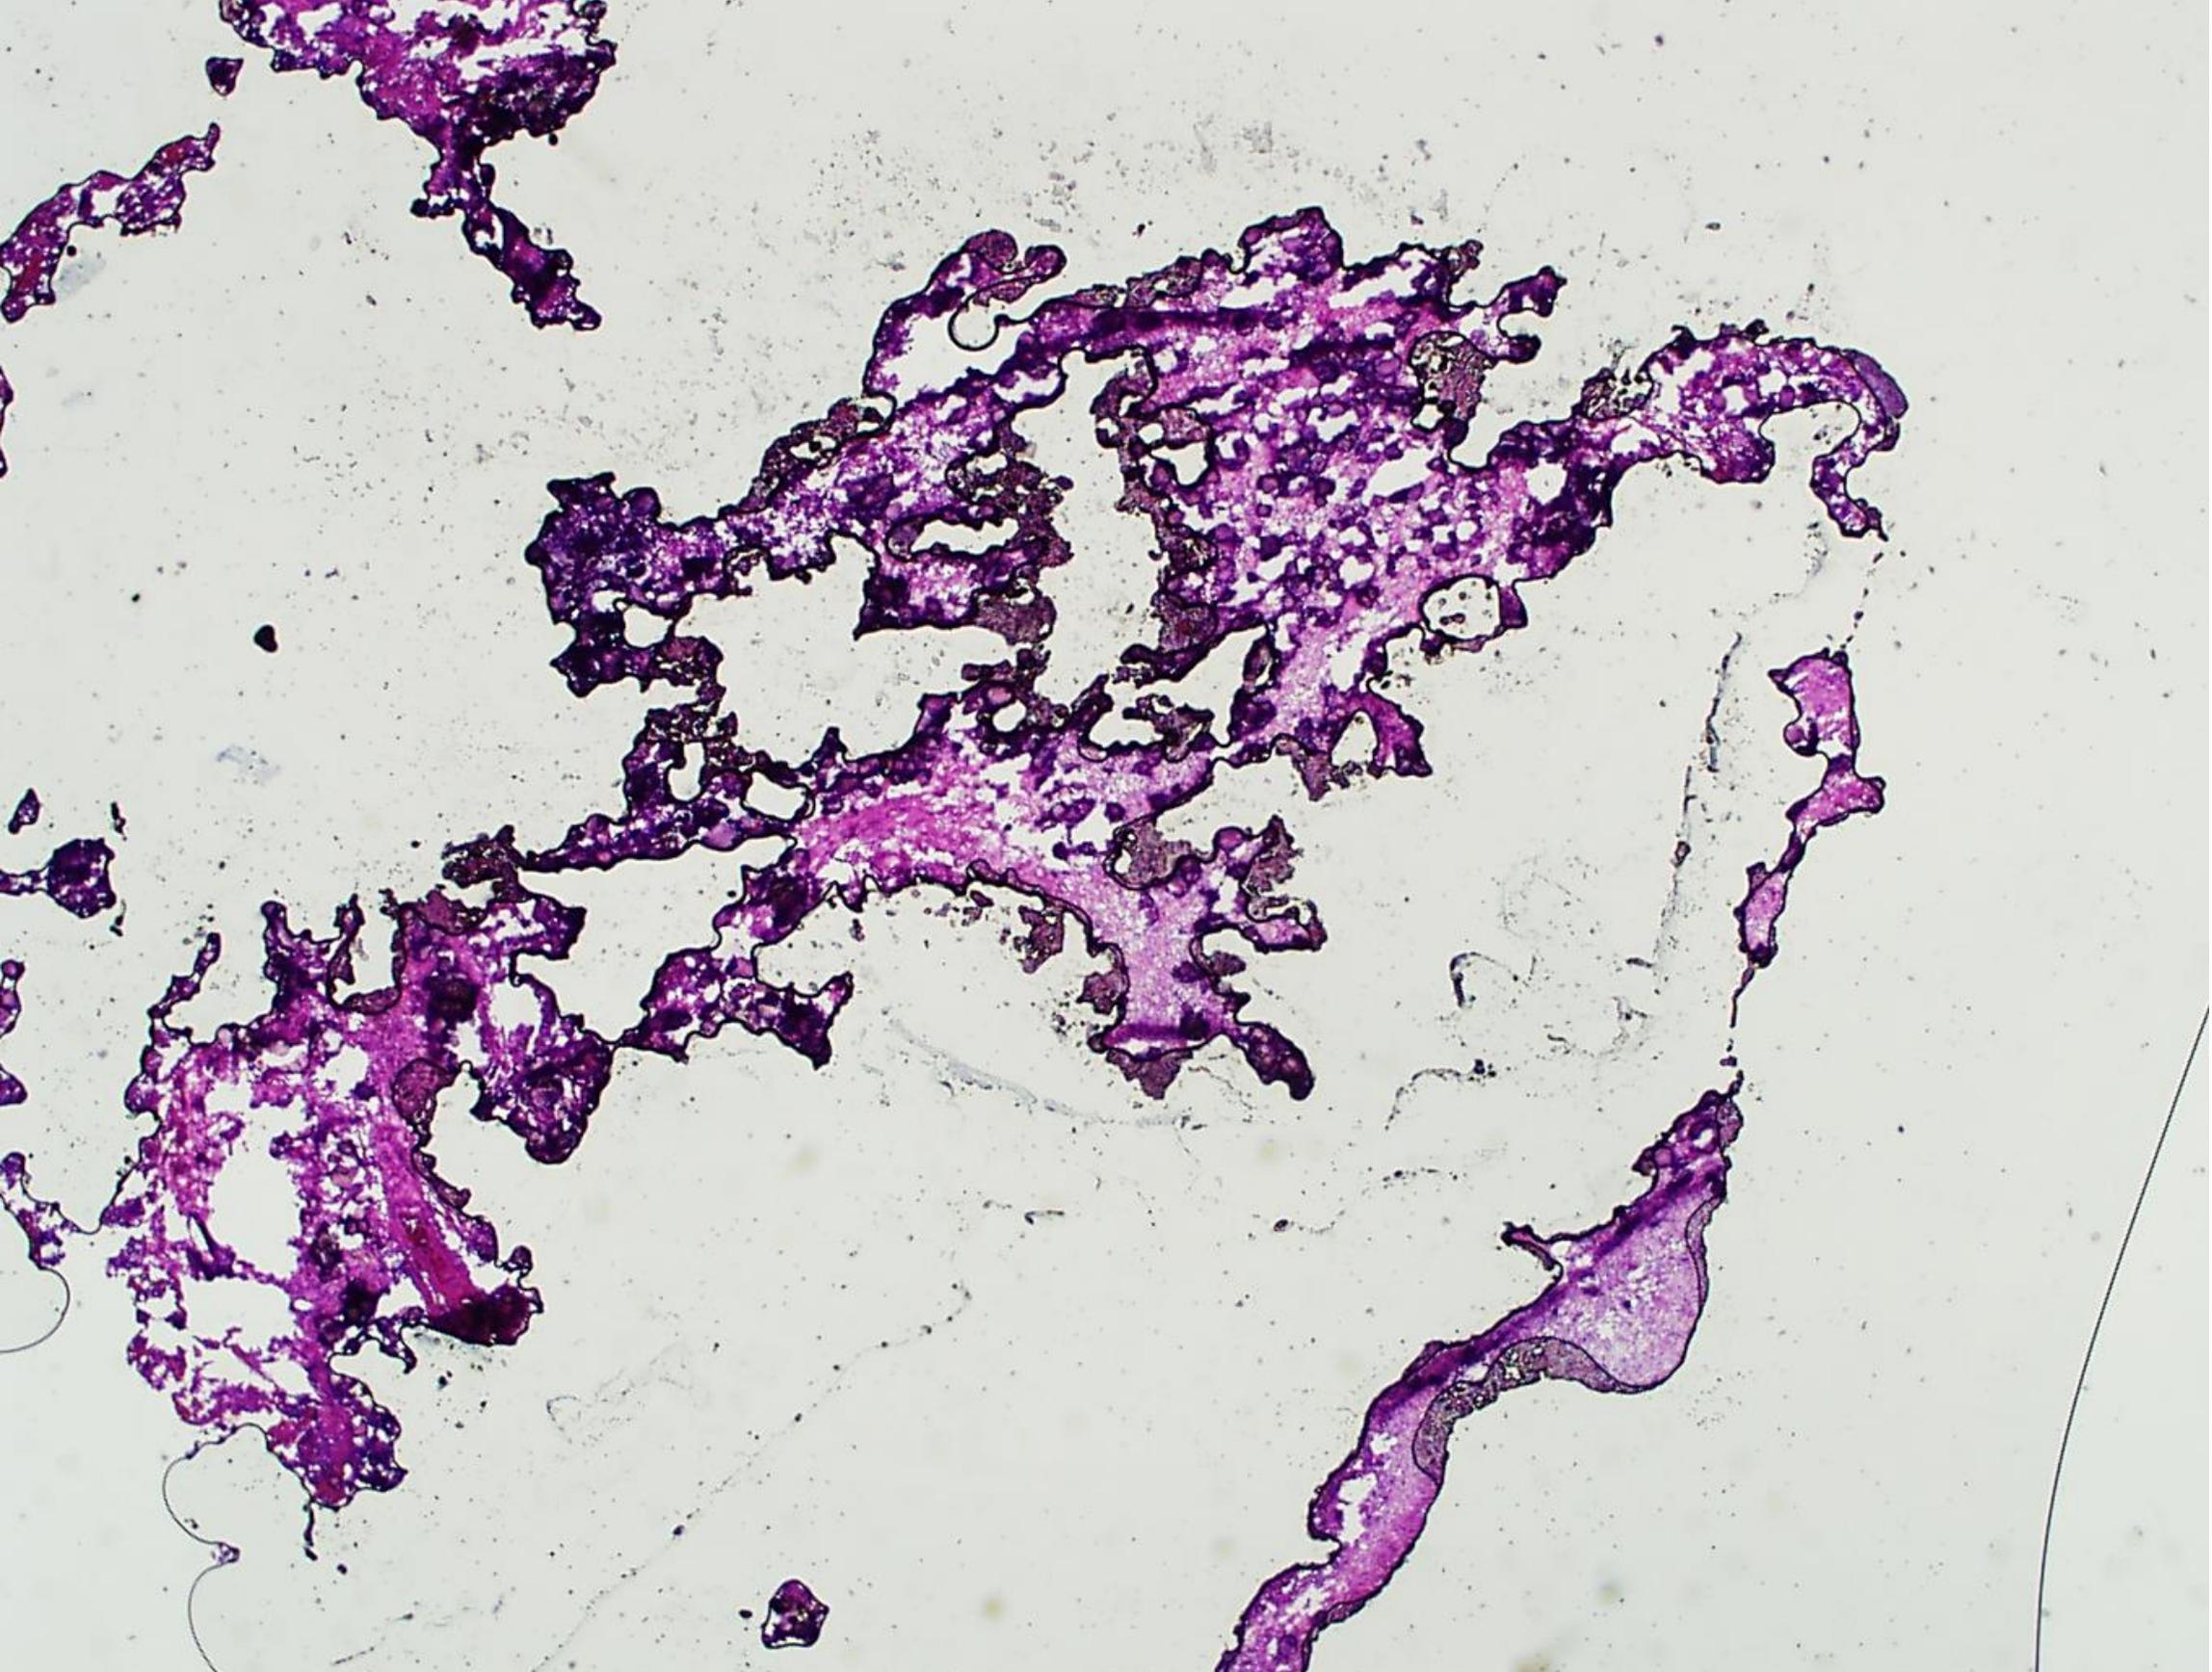

OR

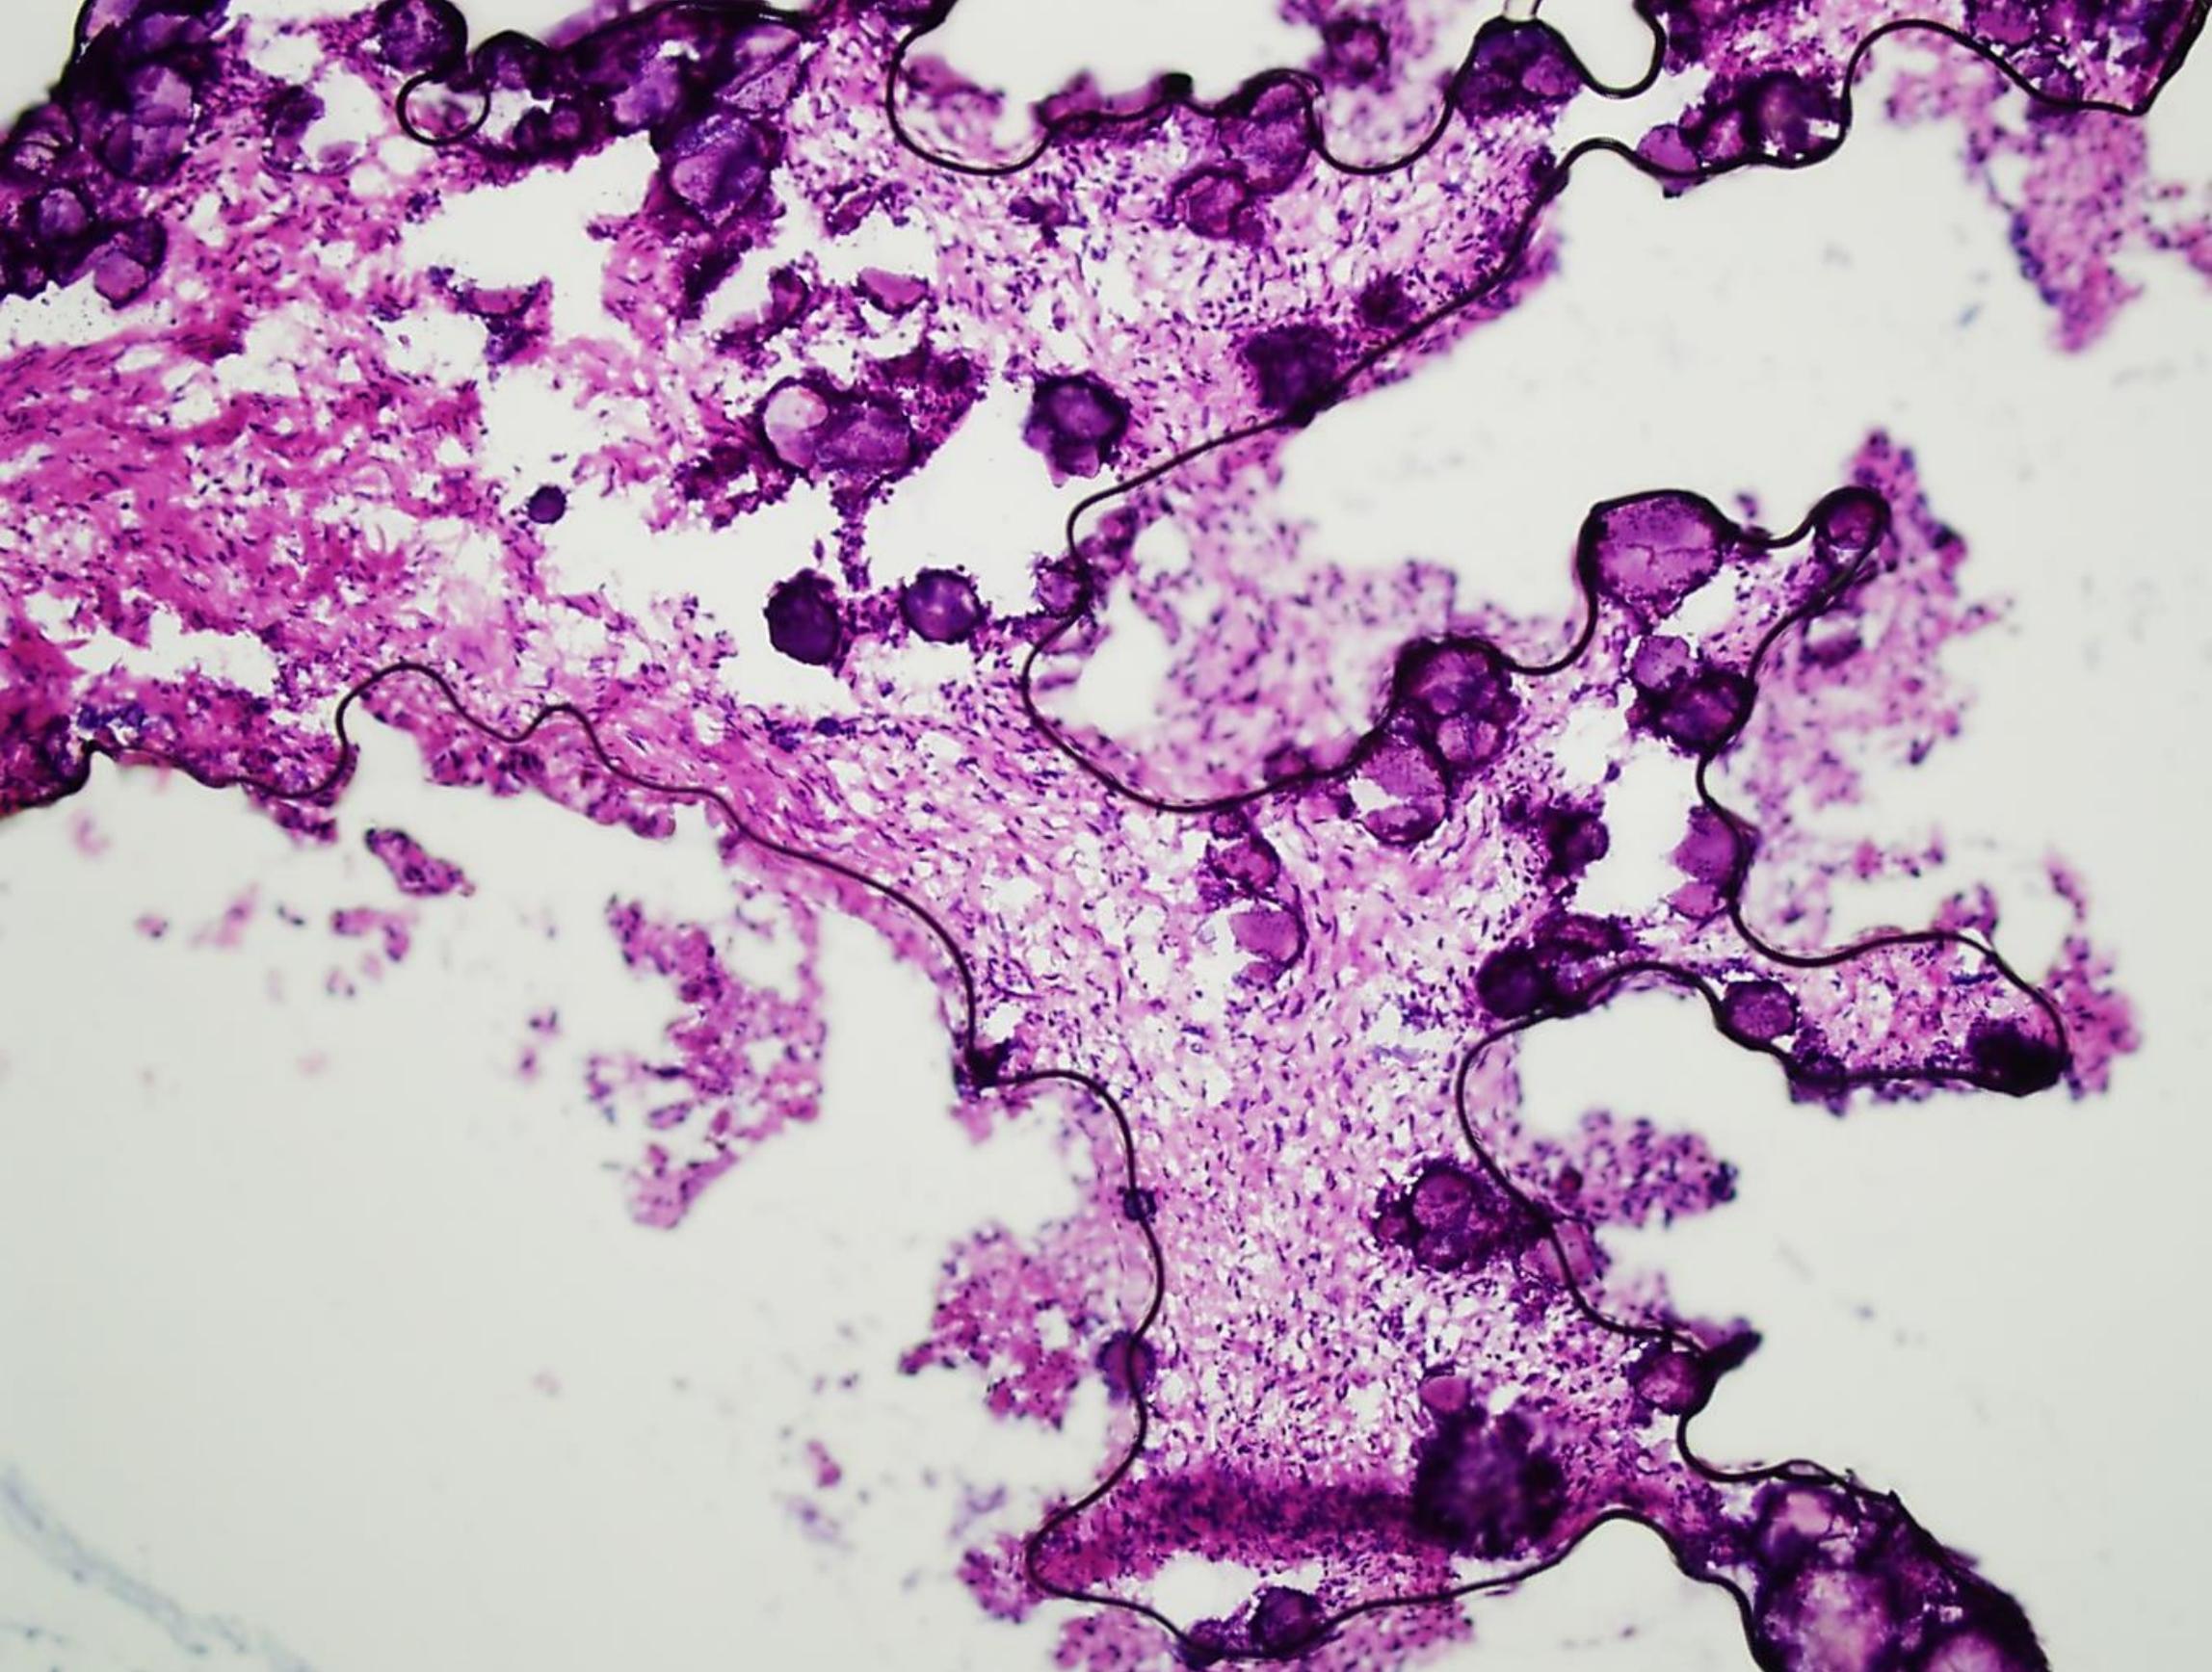

Woman with a complex ovarian mass is taken to surgery for salpingo-oophorectomy and possible staging. Upon entering the peritoneum, the surgeon notes a peritoneal lesion and sends it down for frozen section analysis.

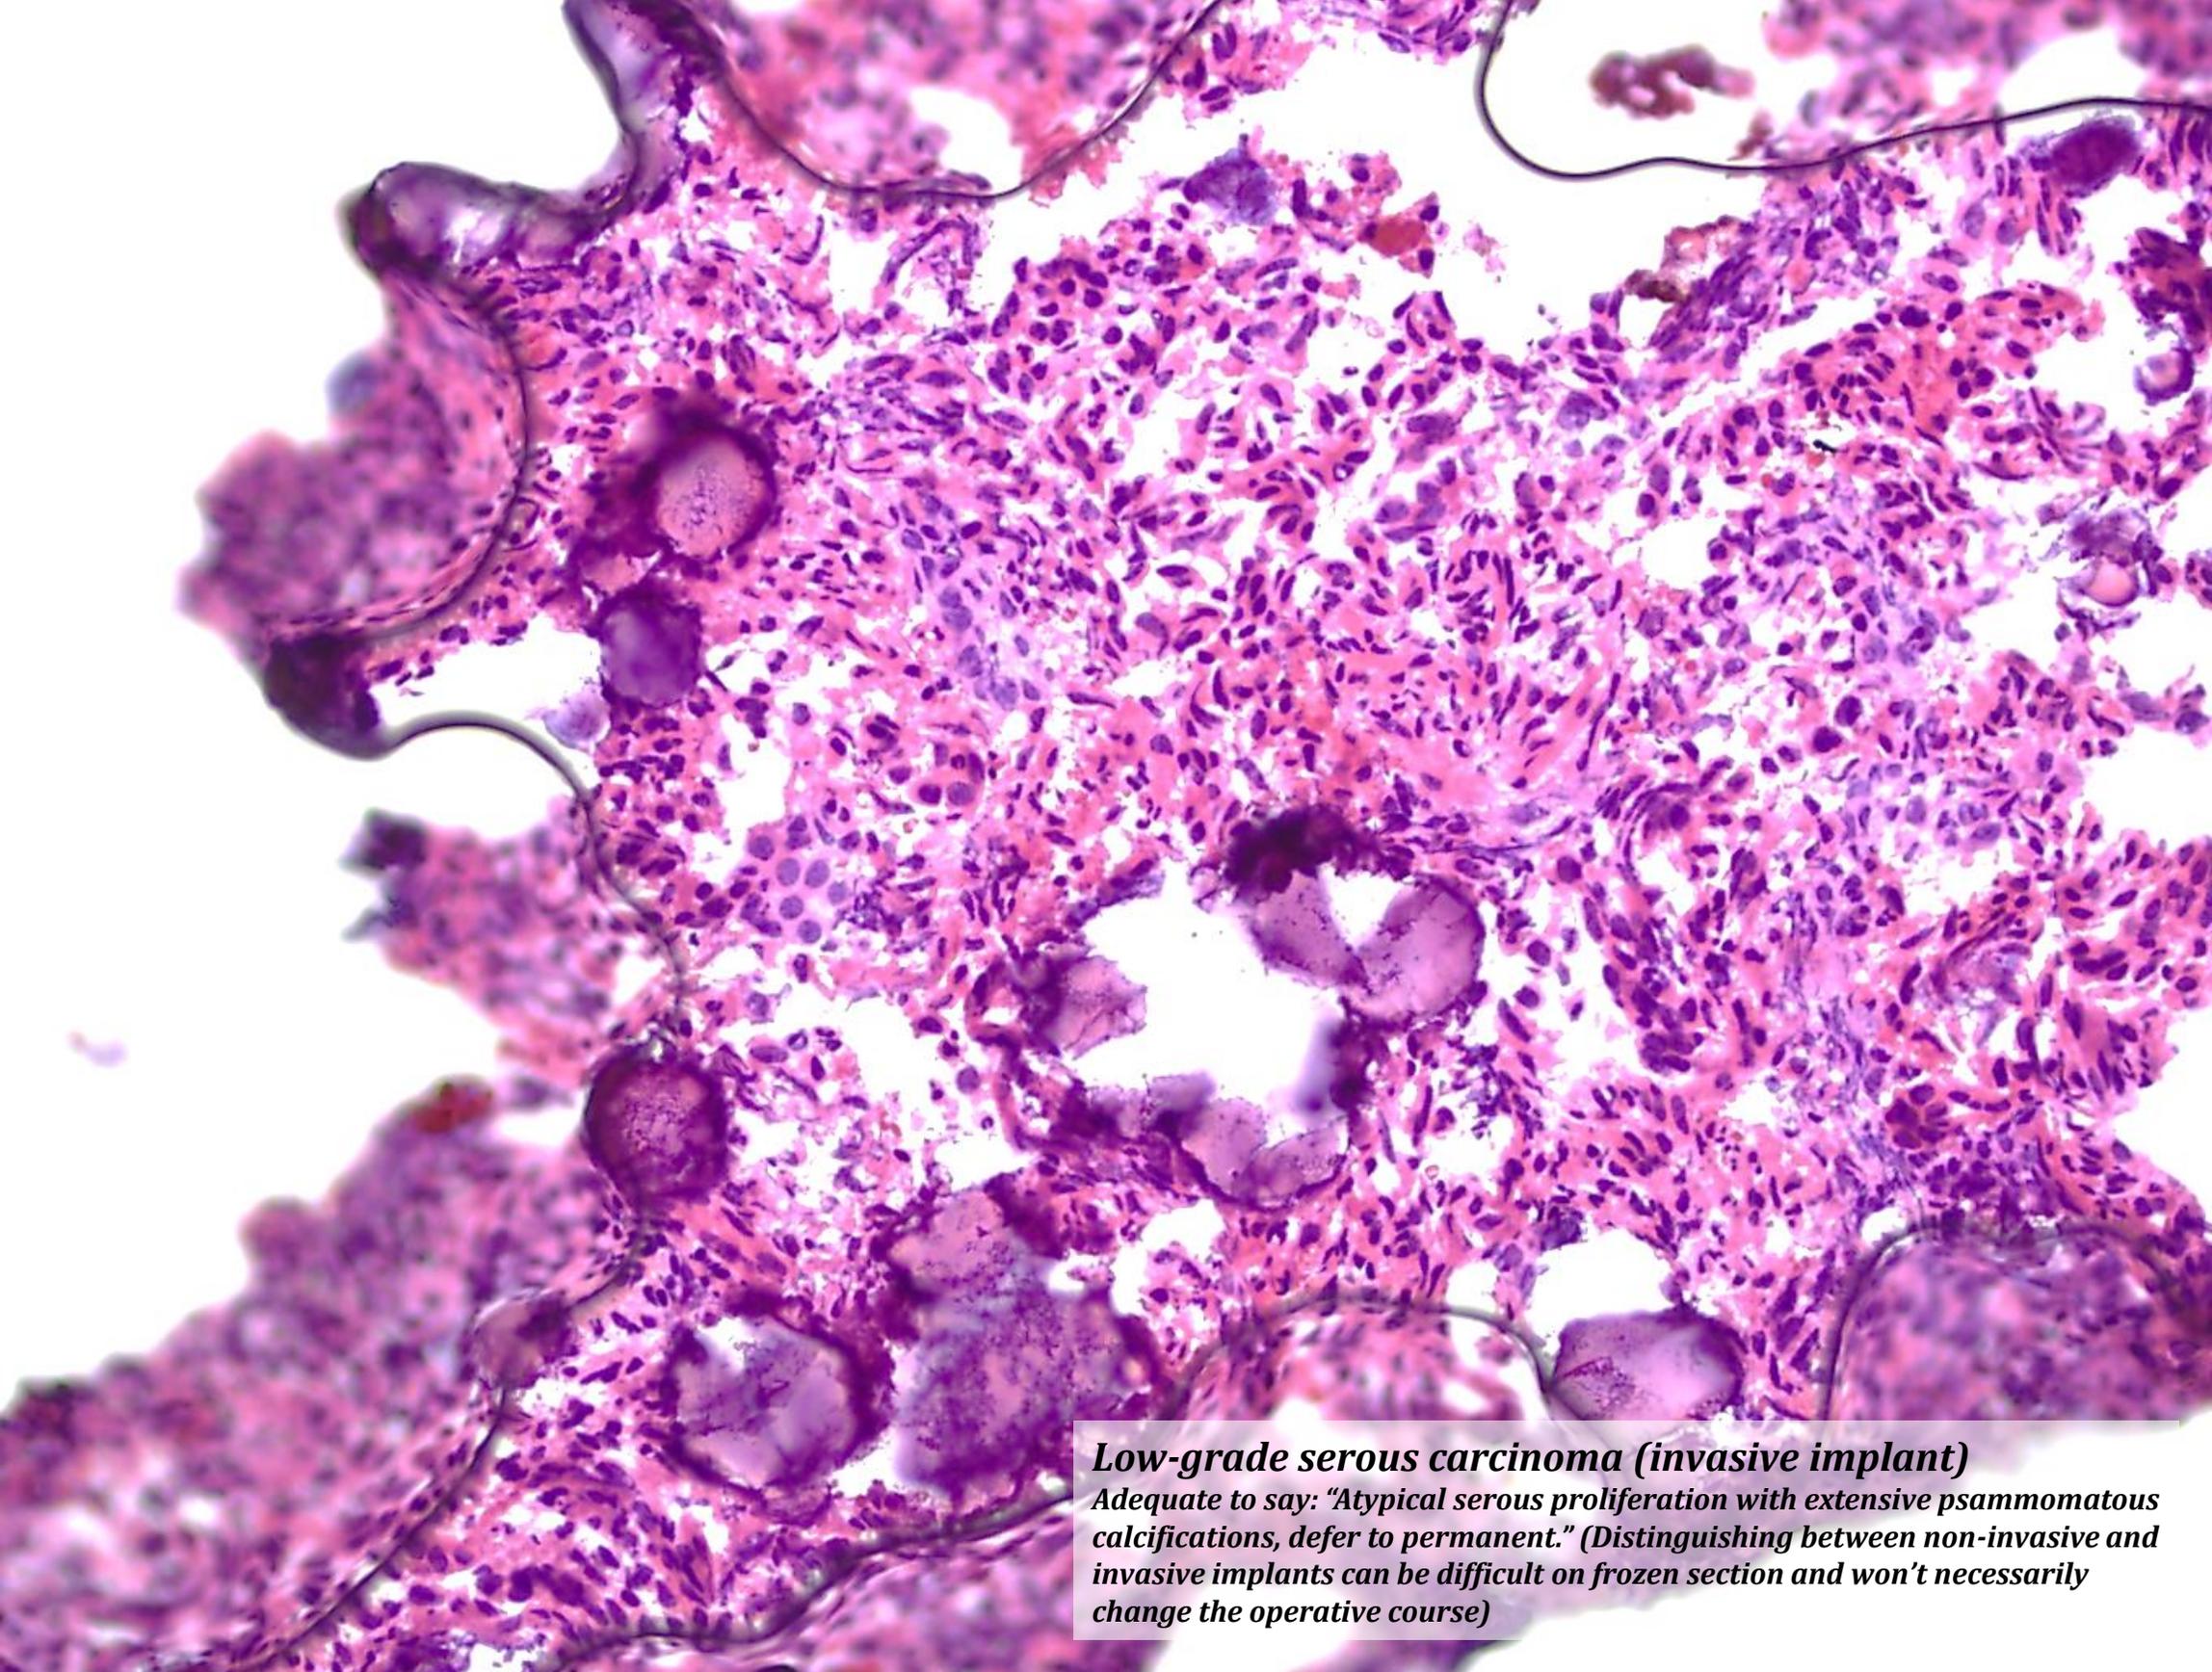

Well-differentiated papillary mesothelioma (WDPM)

Calretinin

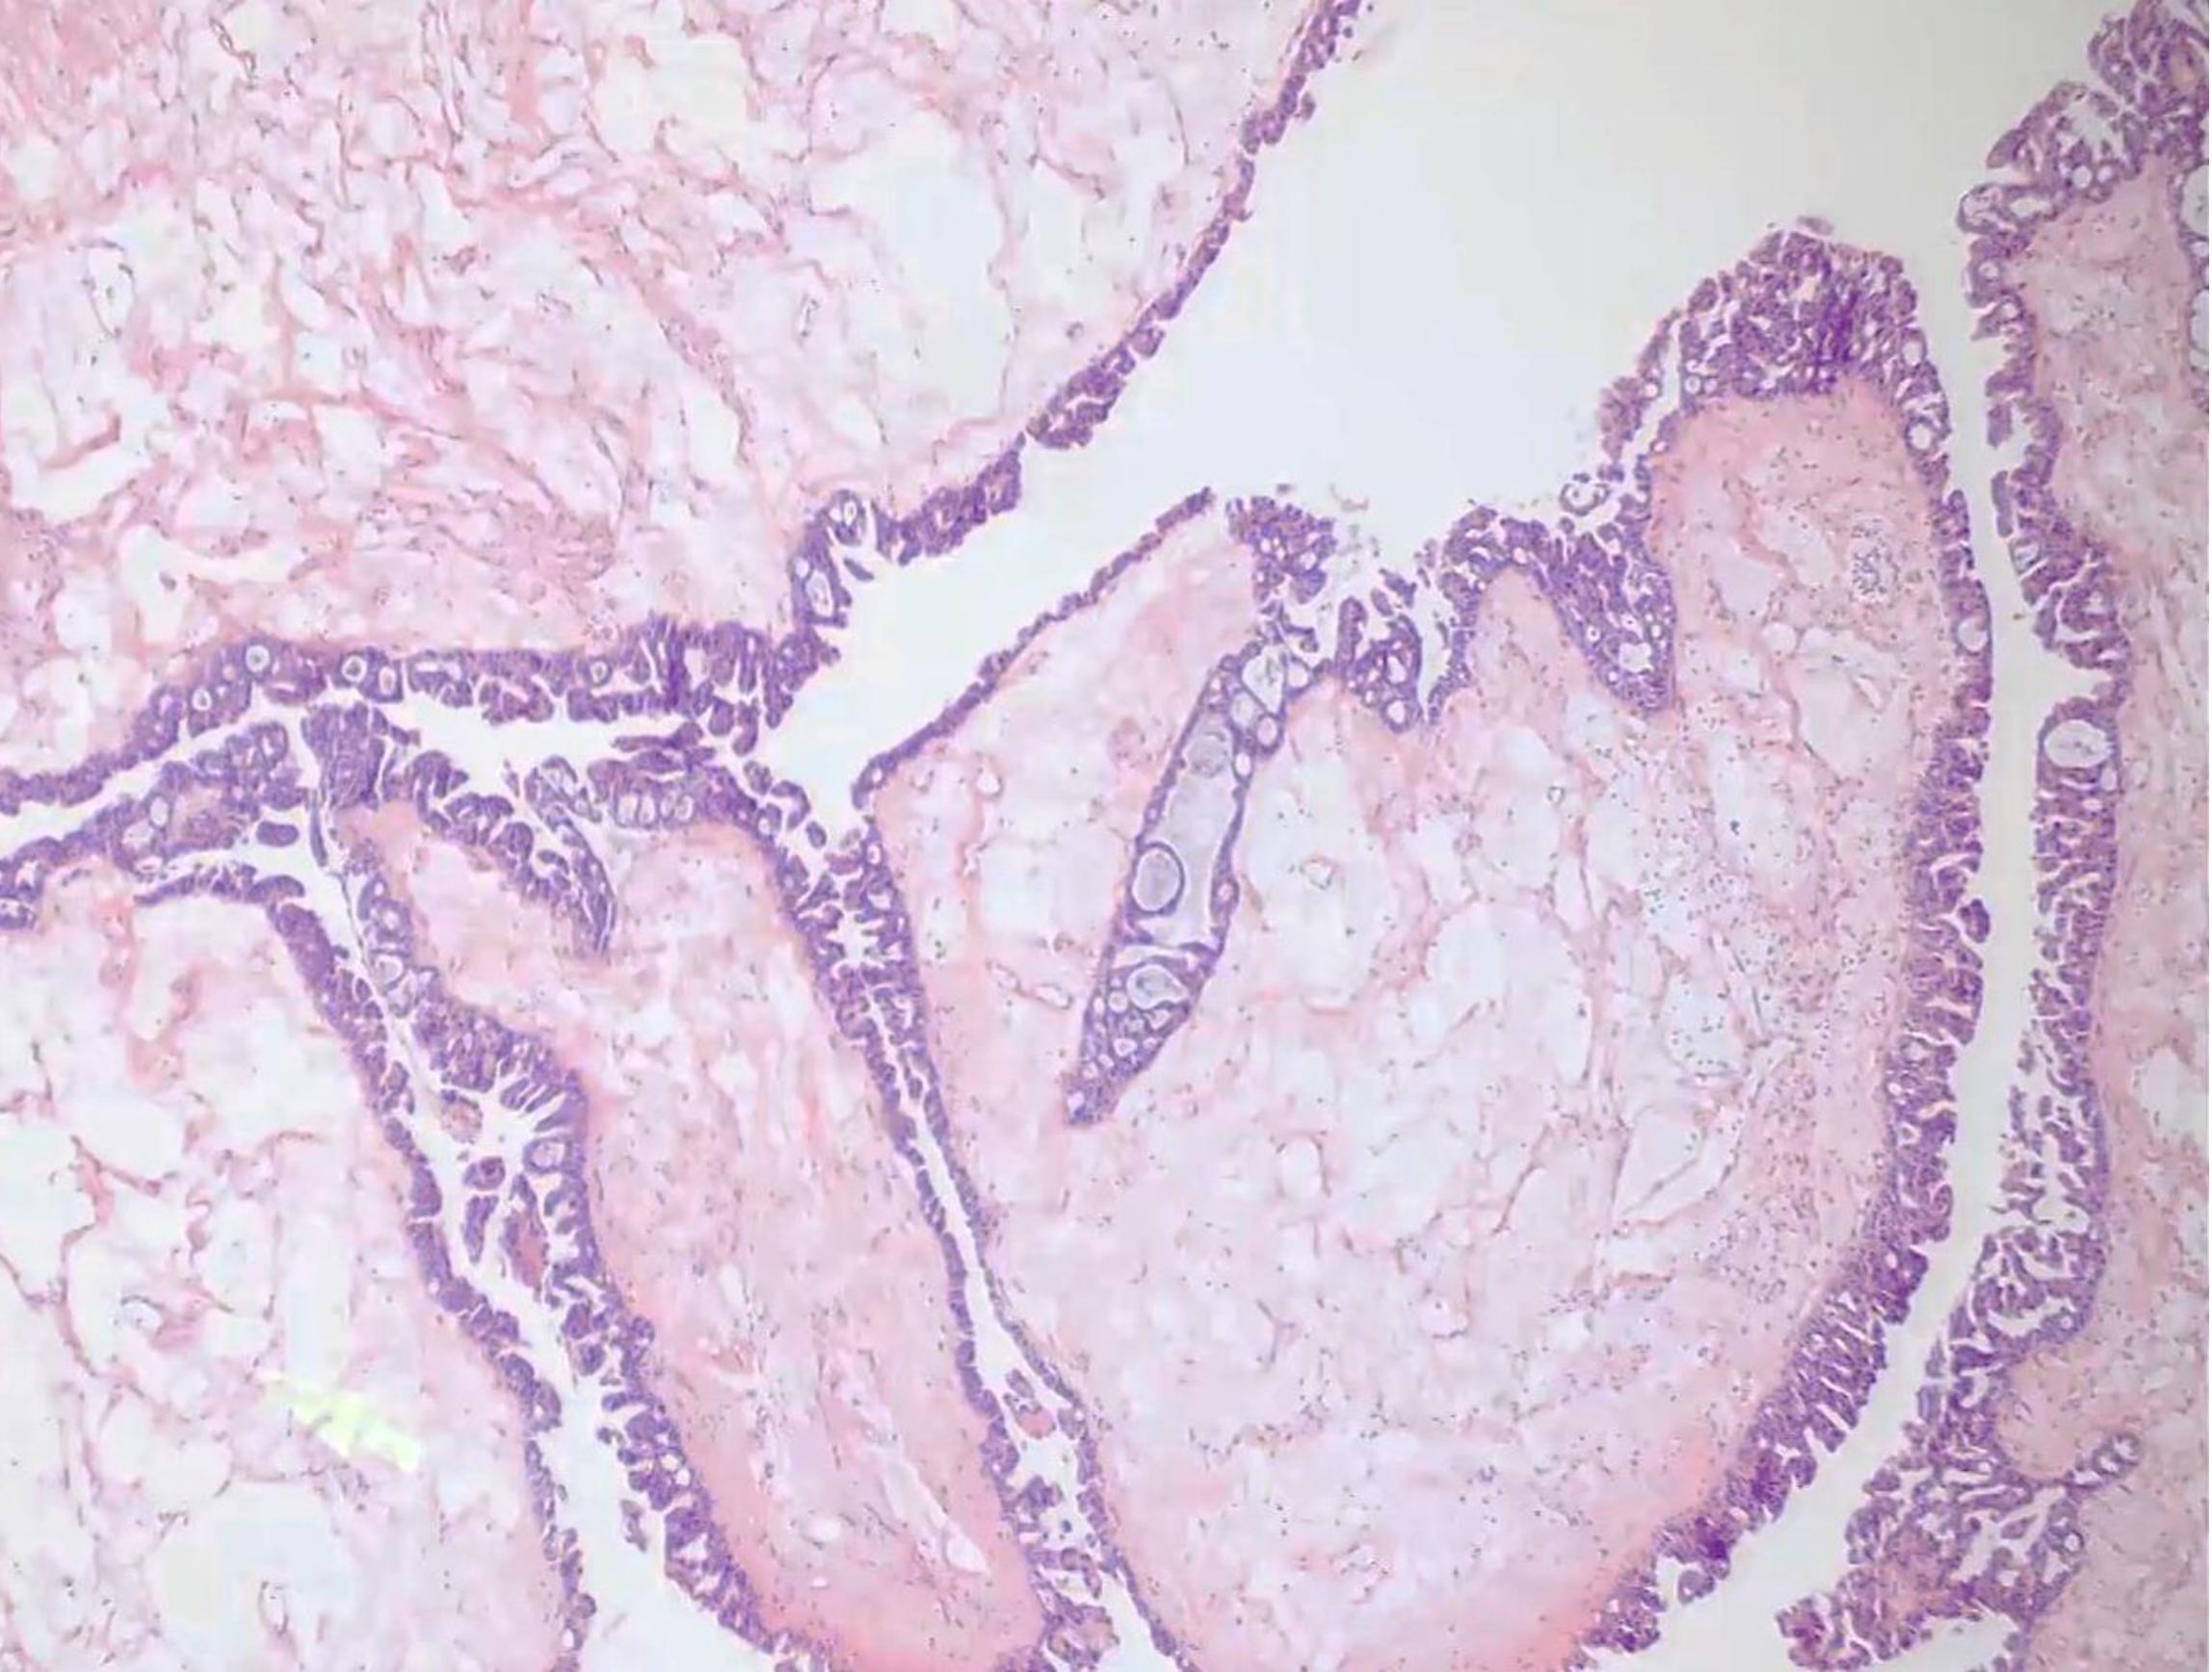

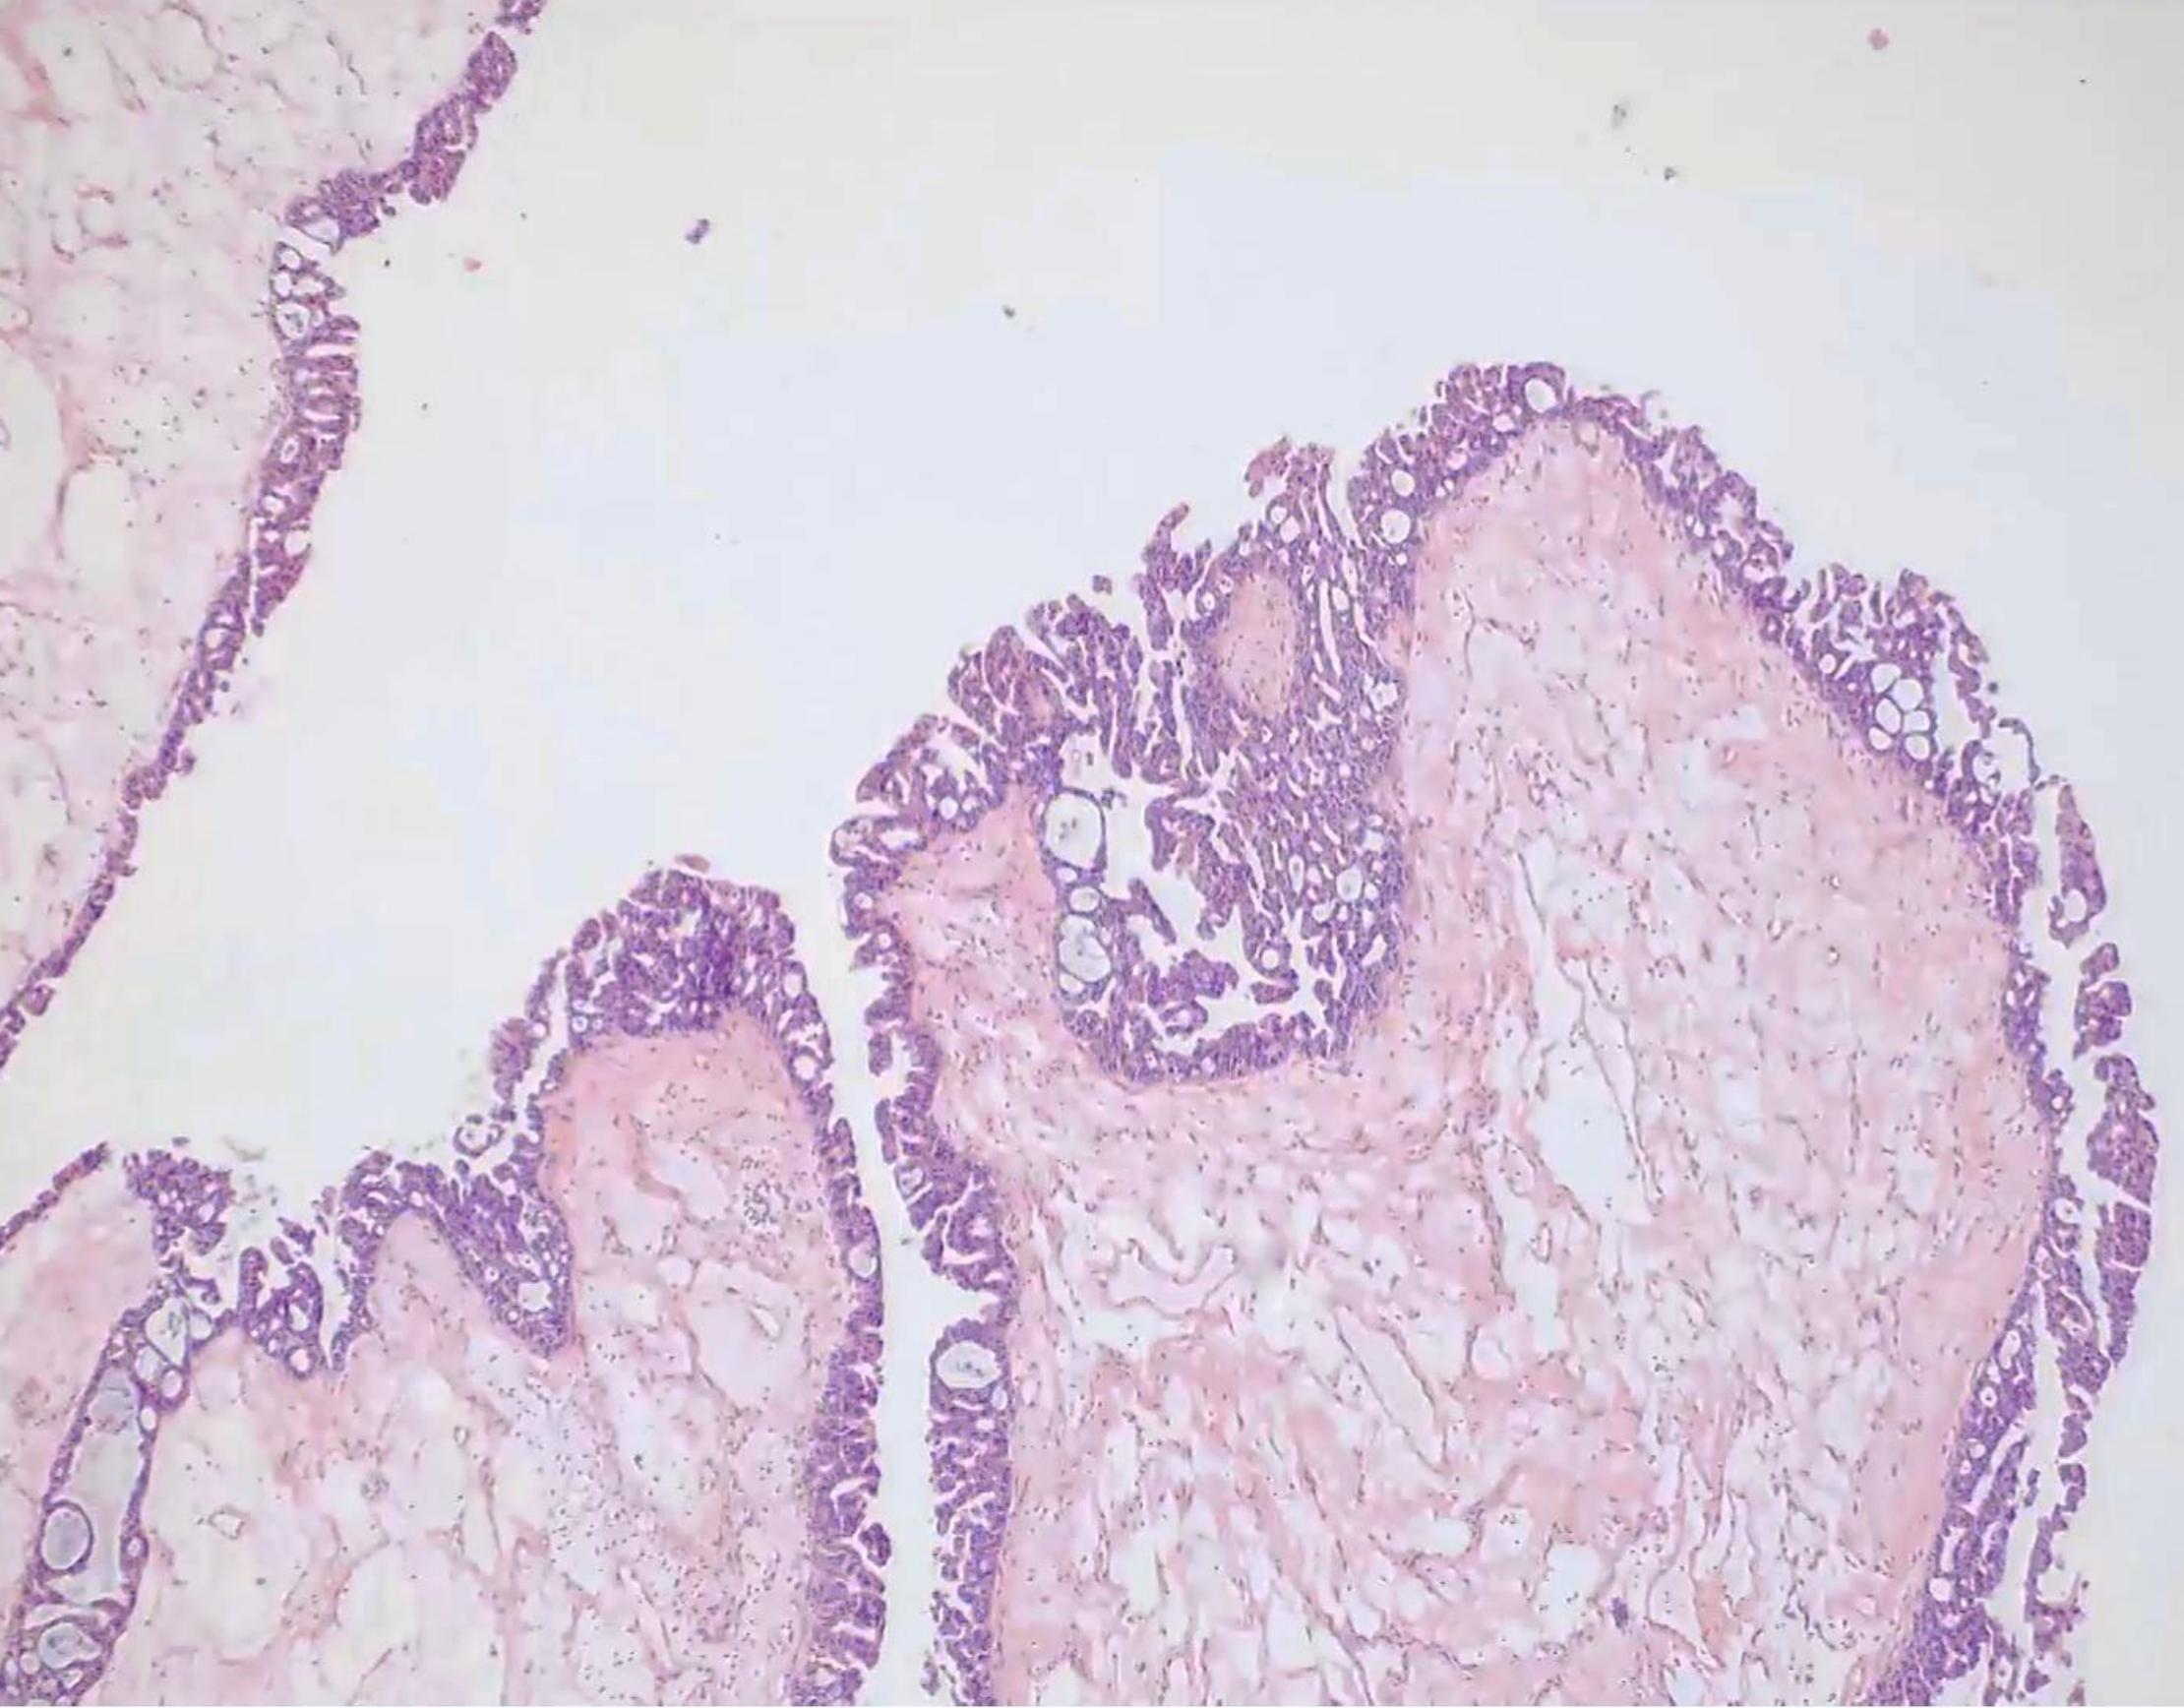

Low-grade serous carcinoma (invasive implant)
Adequate to say: "Atypical serous proliferation with extensive psammomatous calcifications, defer to permanent." (Distinguishing between non-invasive and invasive implants can be difficult on frozen section and won't necessarily change the operative course)

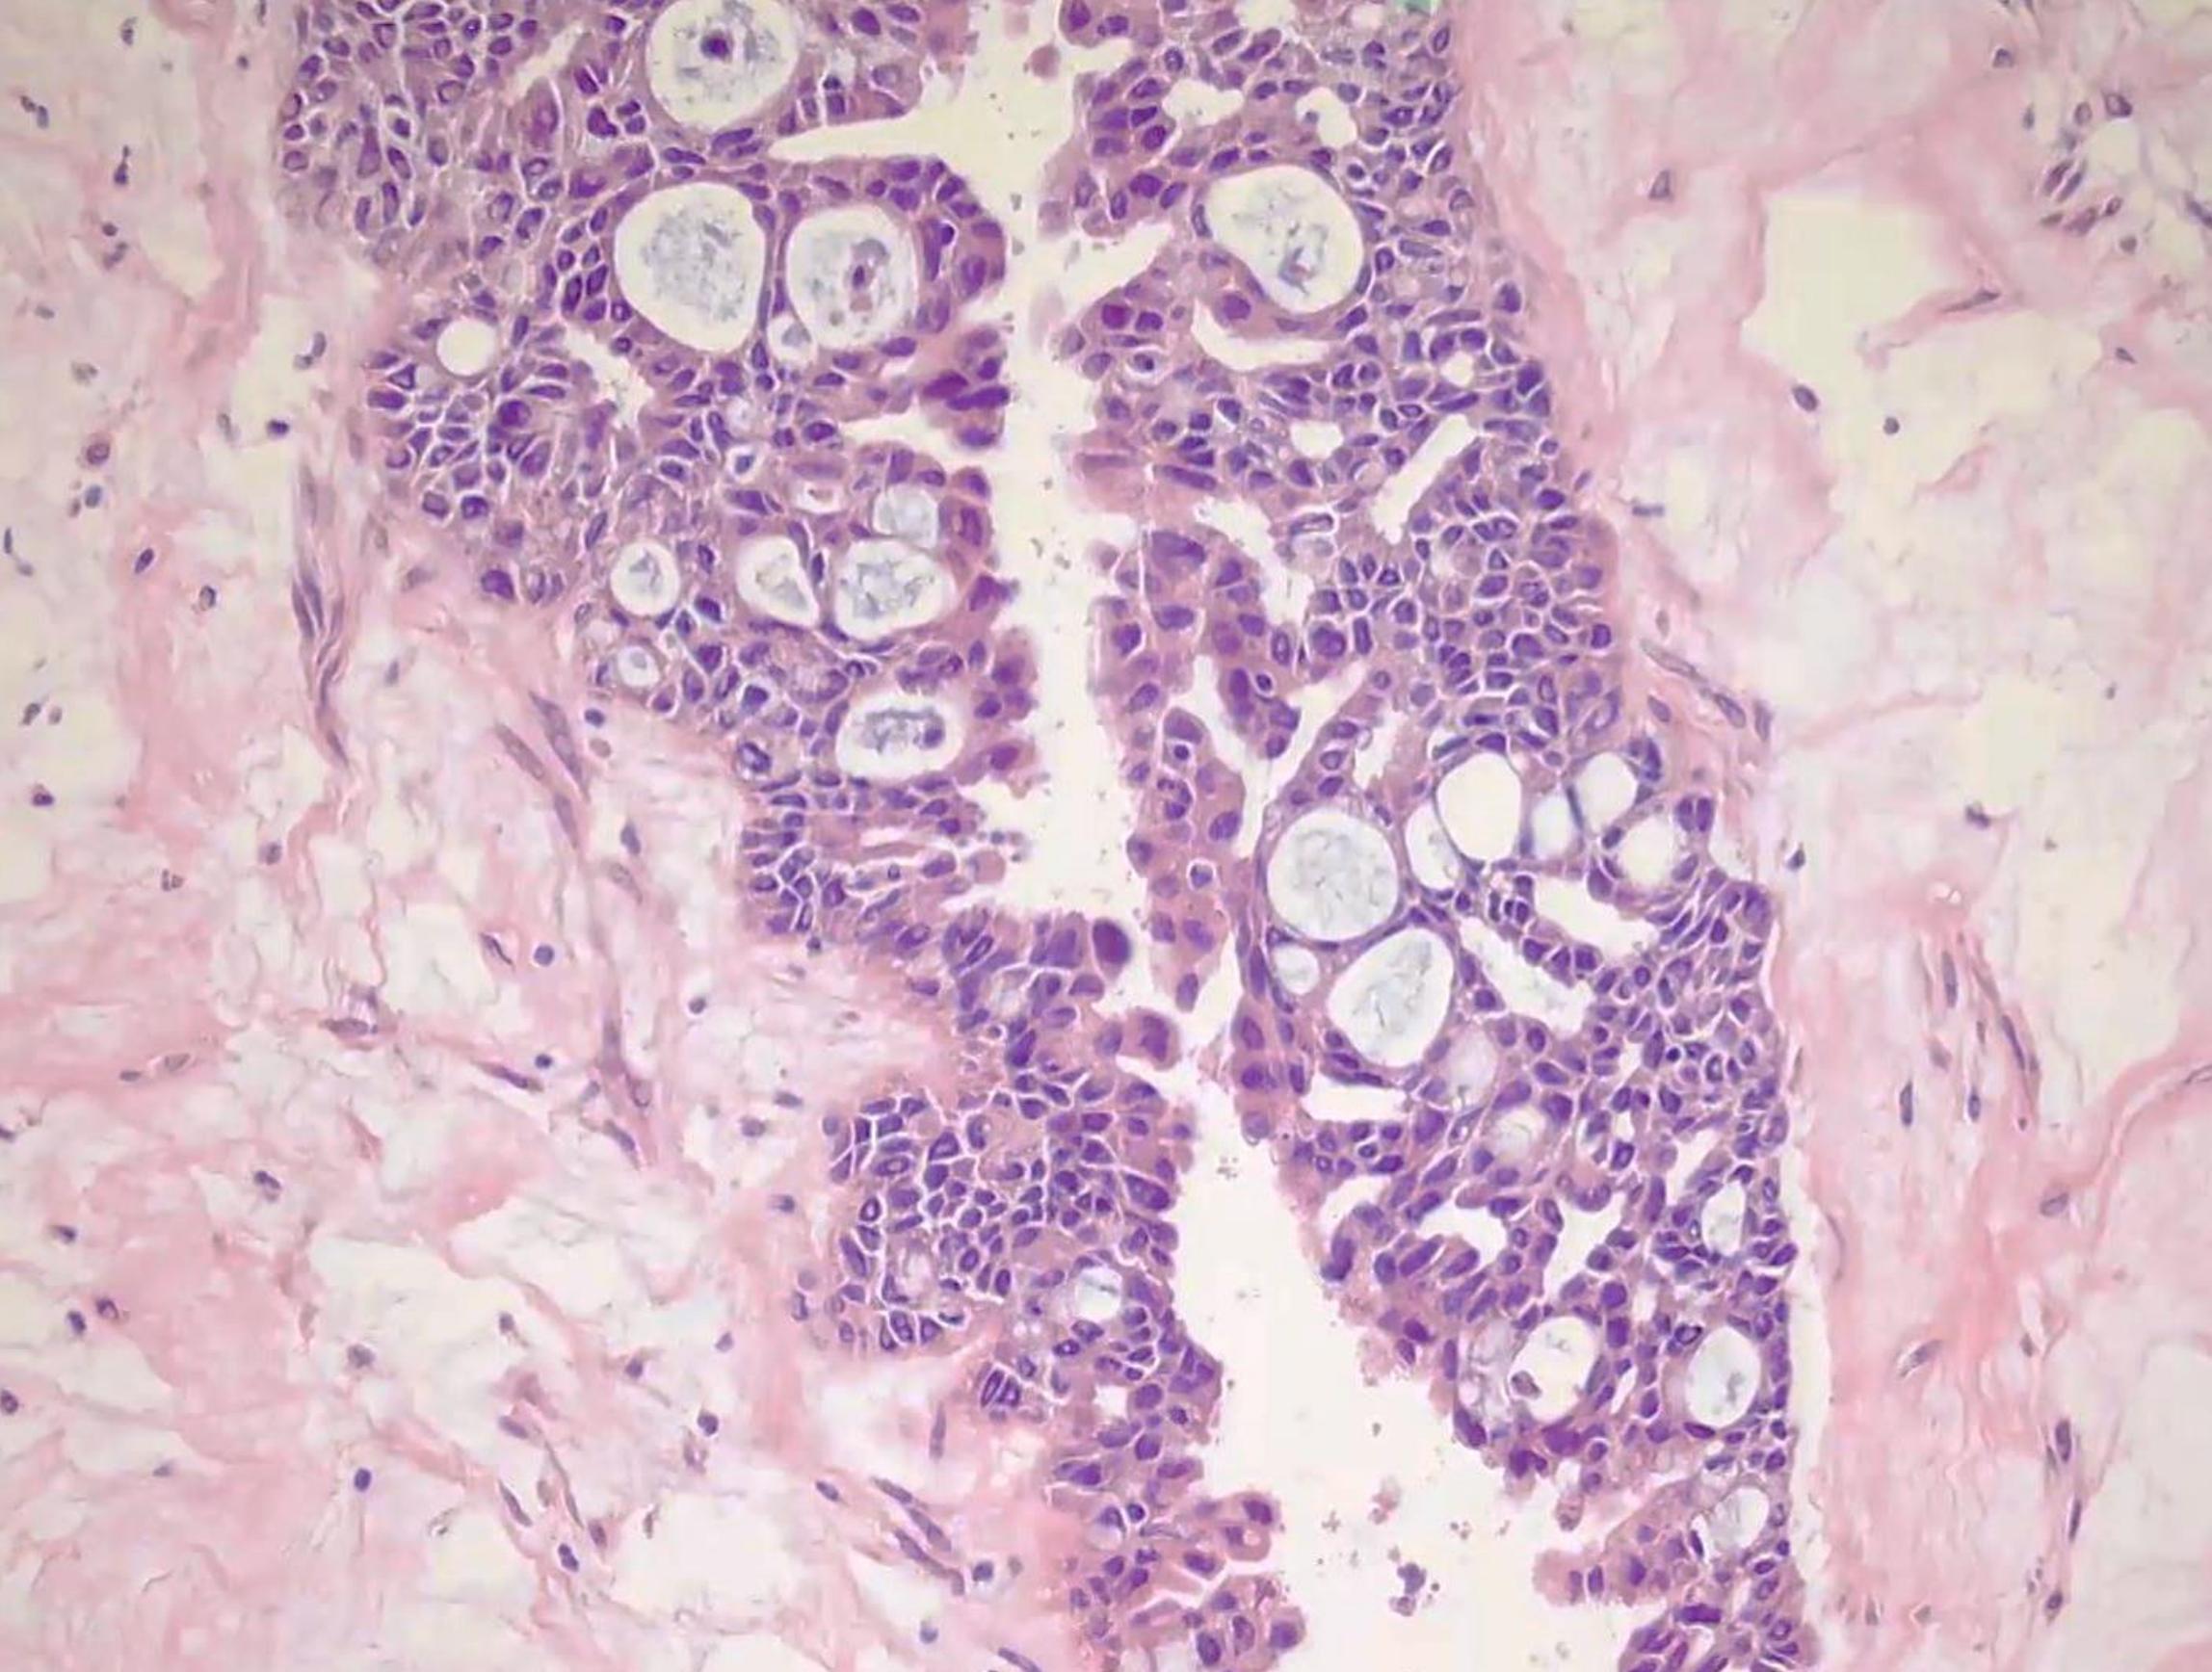

Pitfall #3

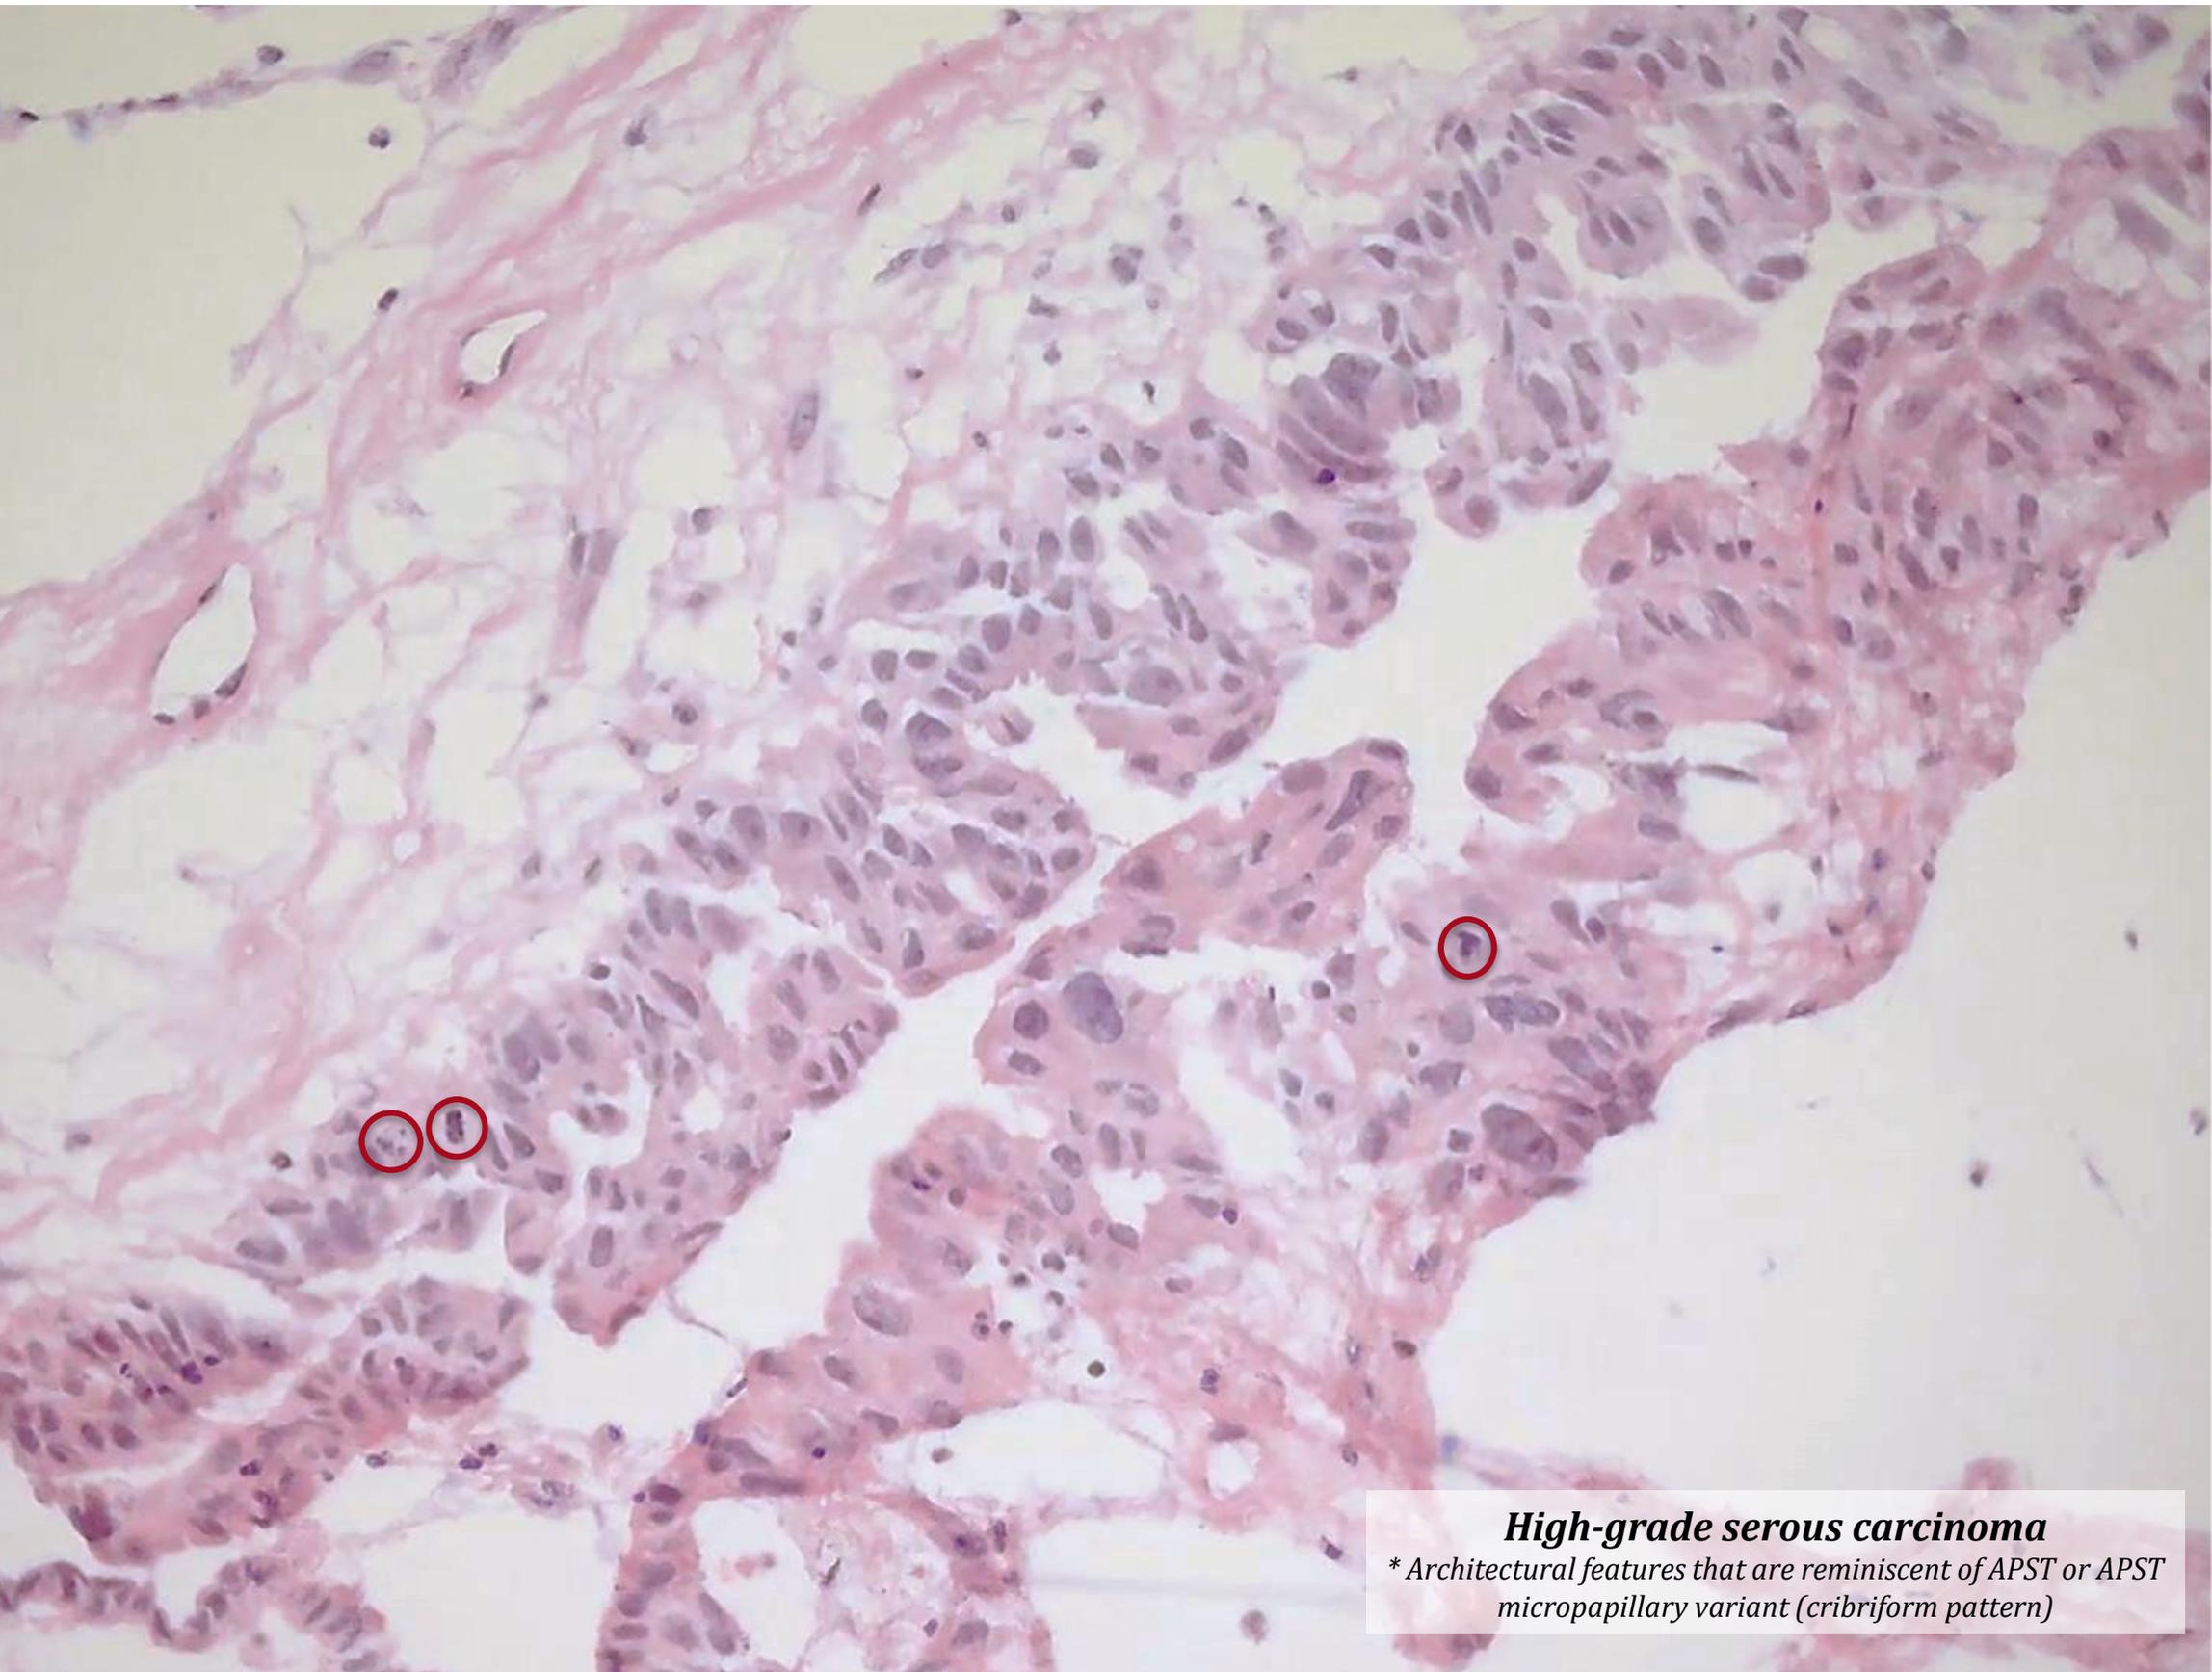

SCENARIO:

Postmenopausal woman with a complex cystic ovarian mass undergoing salpingo-oophorectomy. Frozen section requested on the ovary.

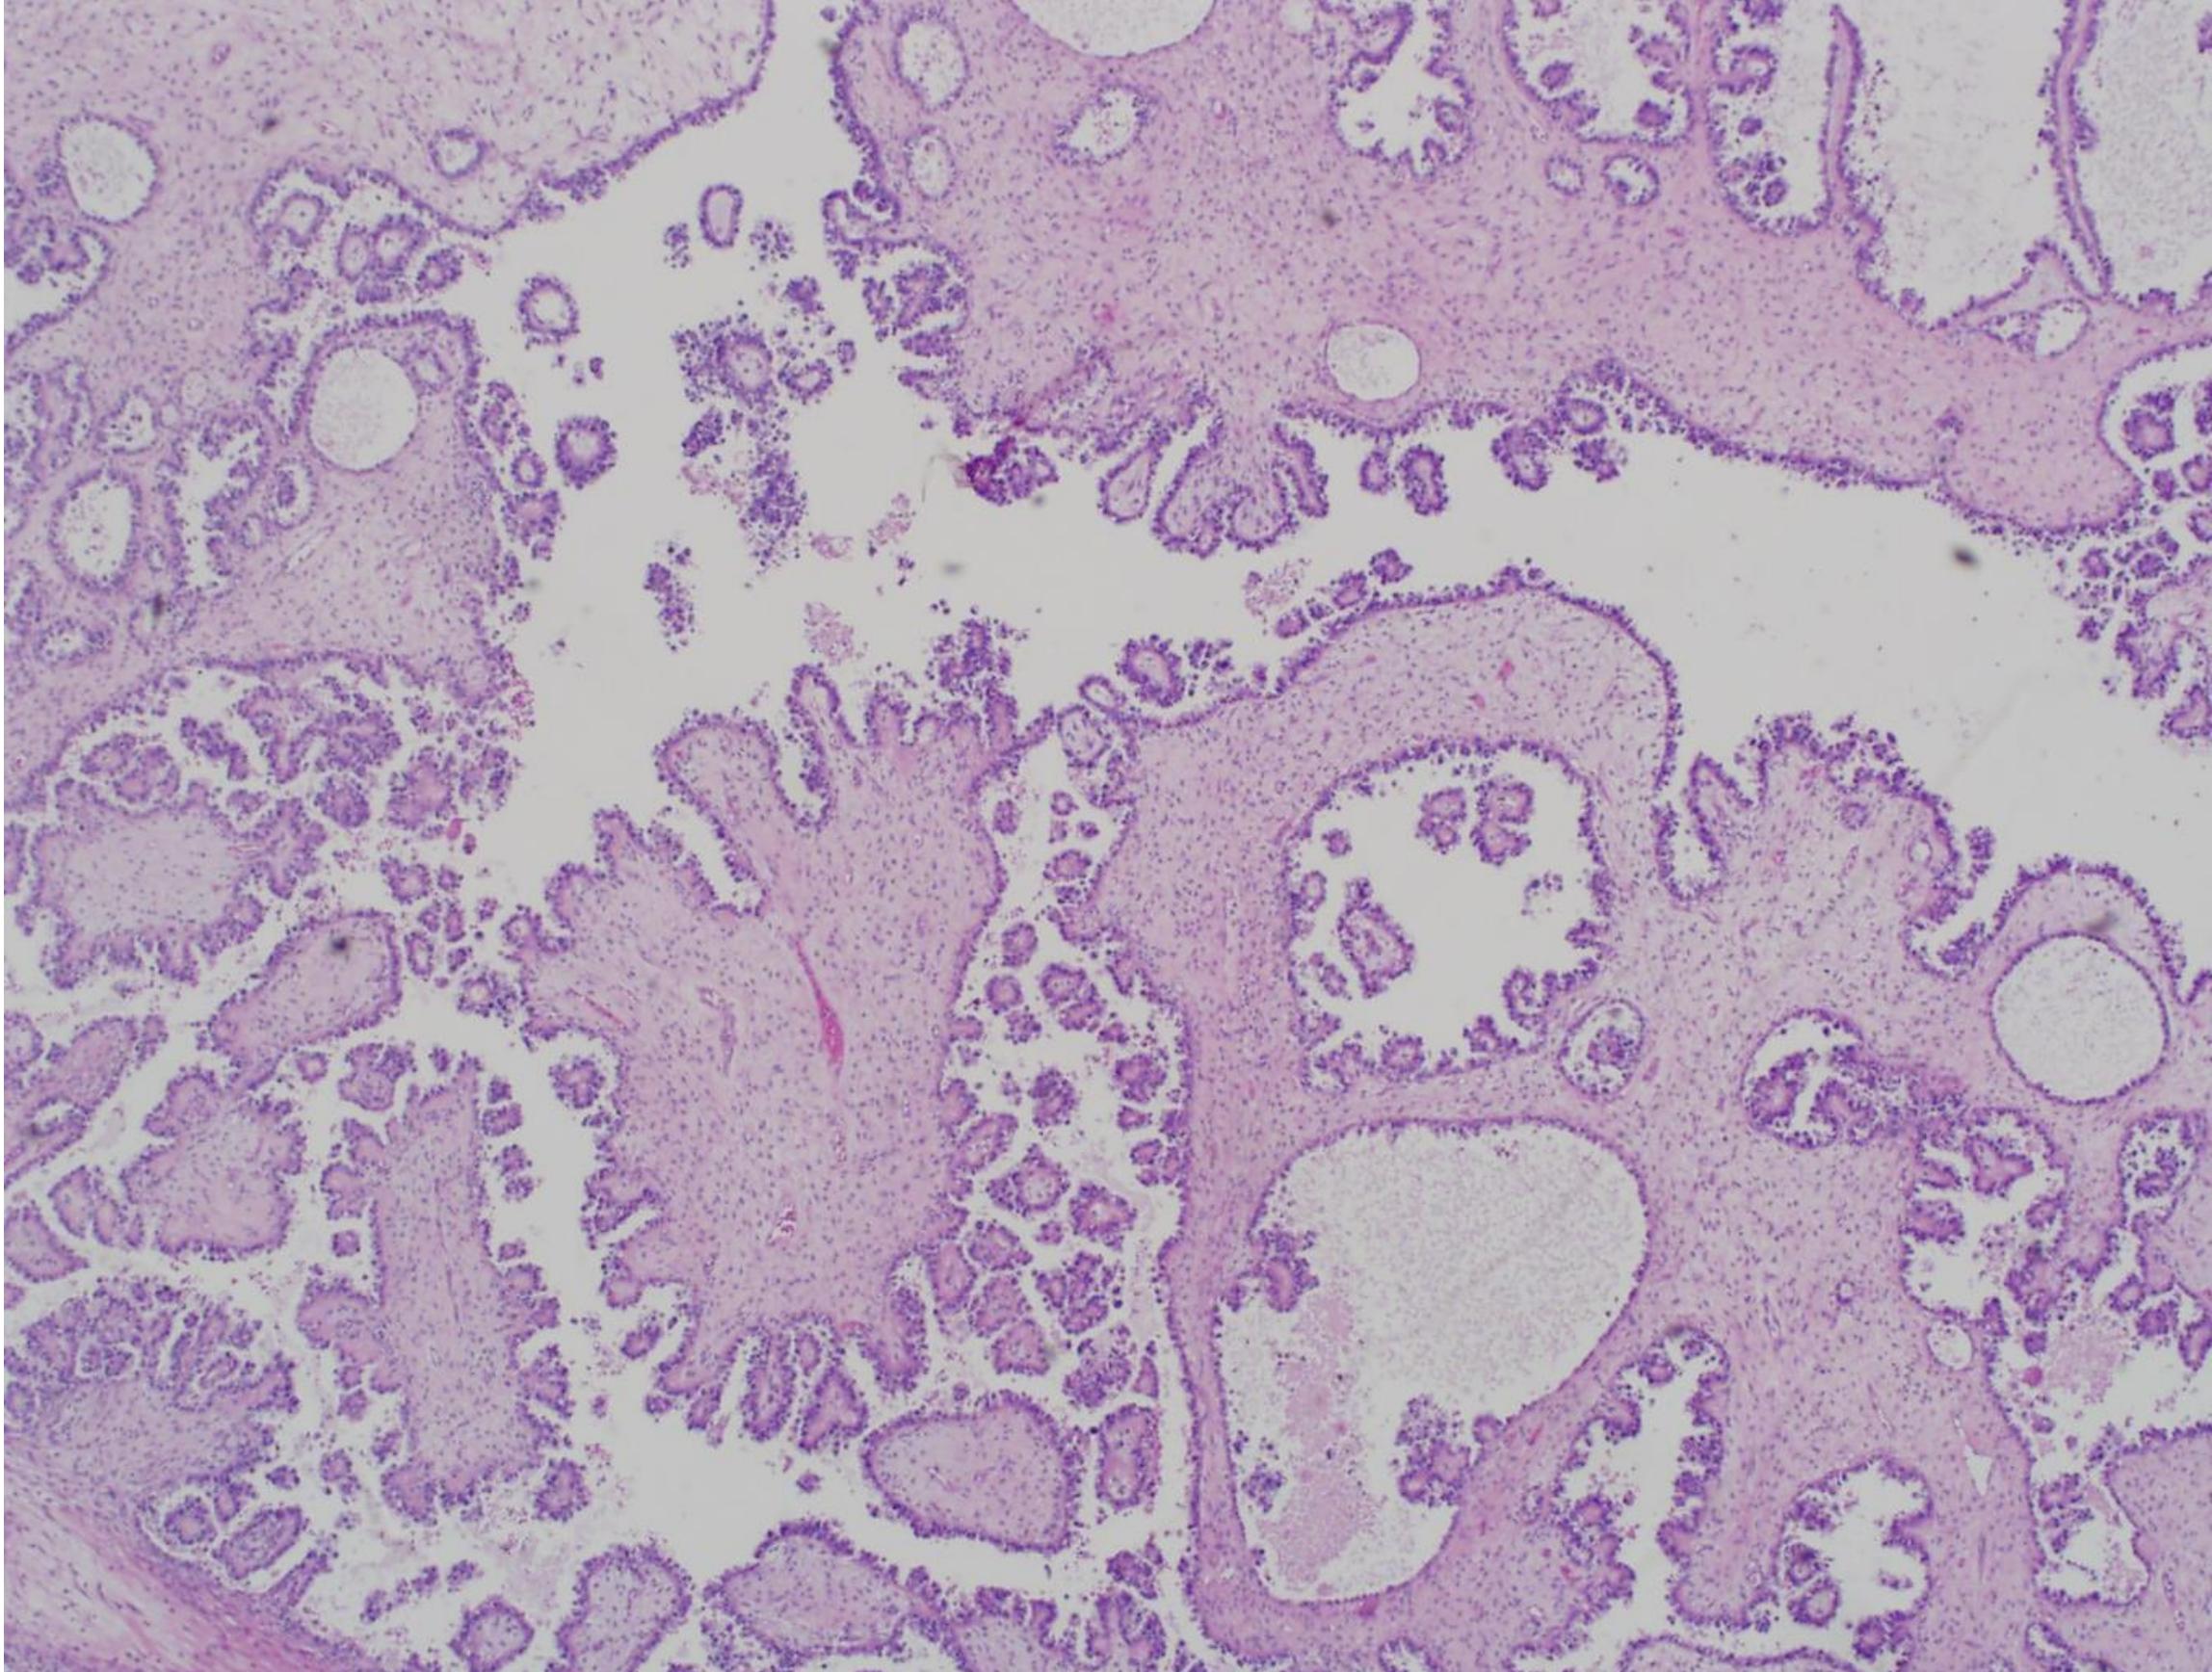

High-grade serous carcinoma

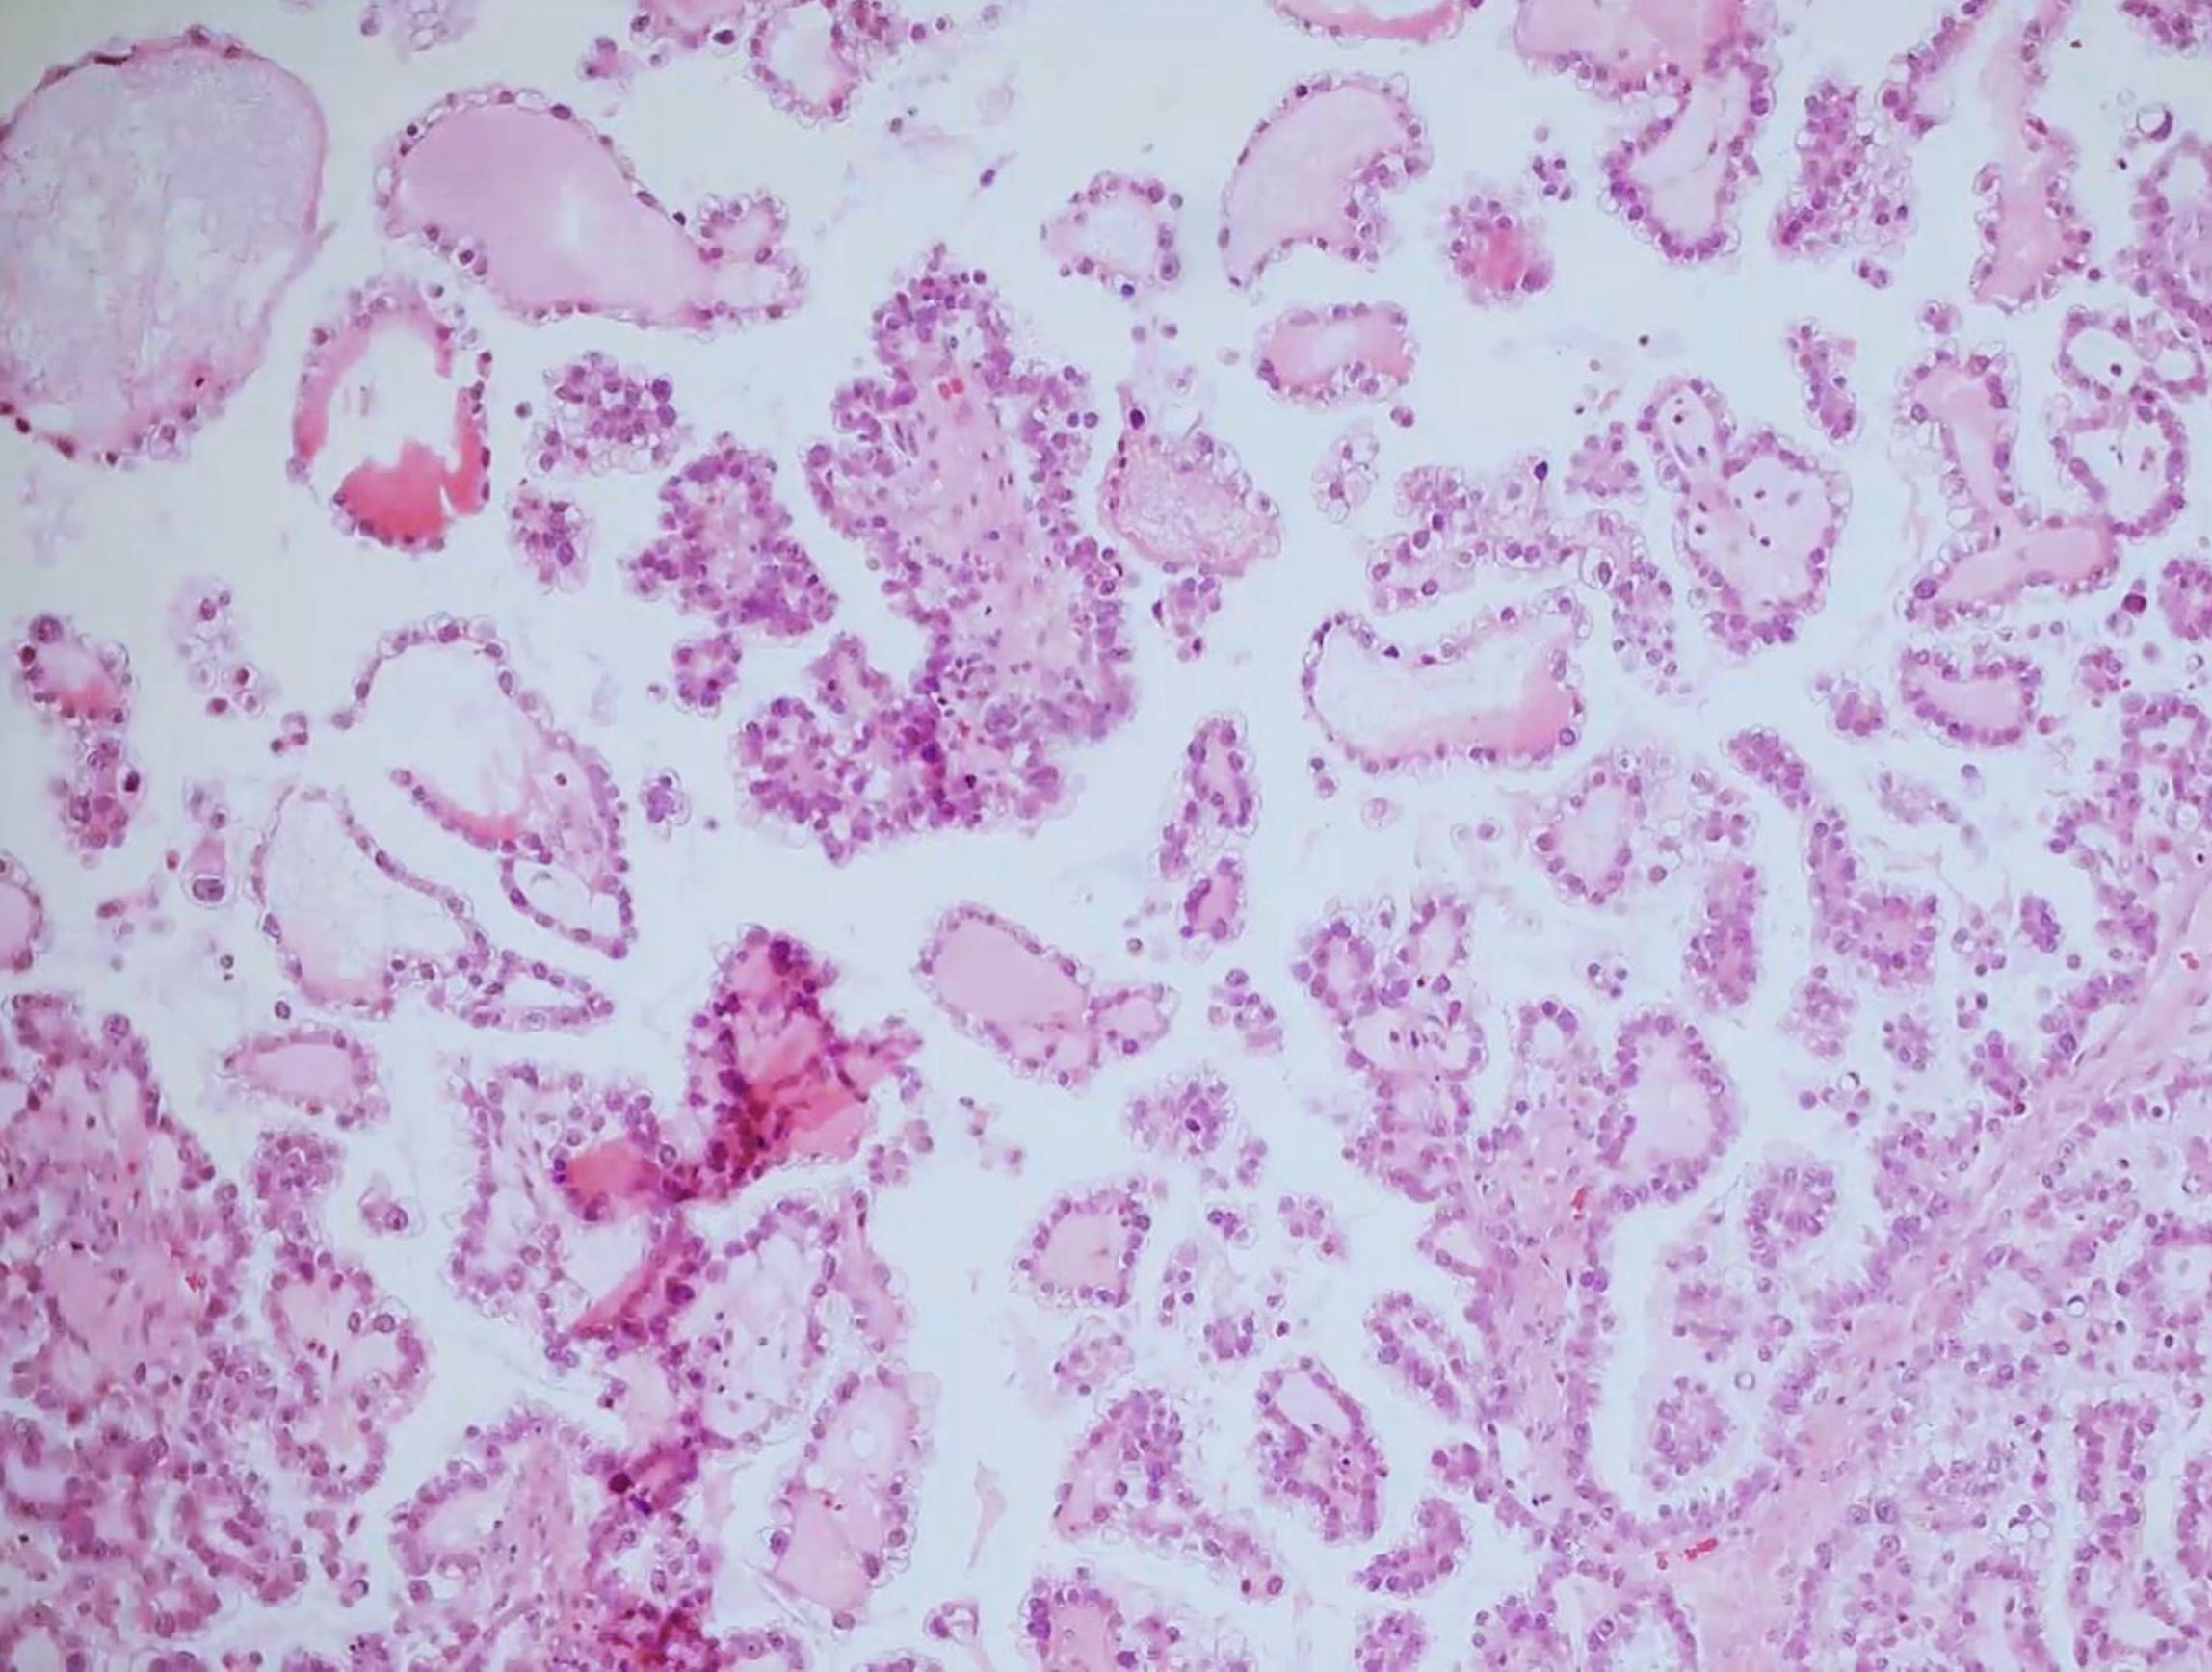

** Architectural features that are reminiscent of APST or APST micropapillary variant (cribriform pattern)*

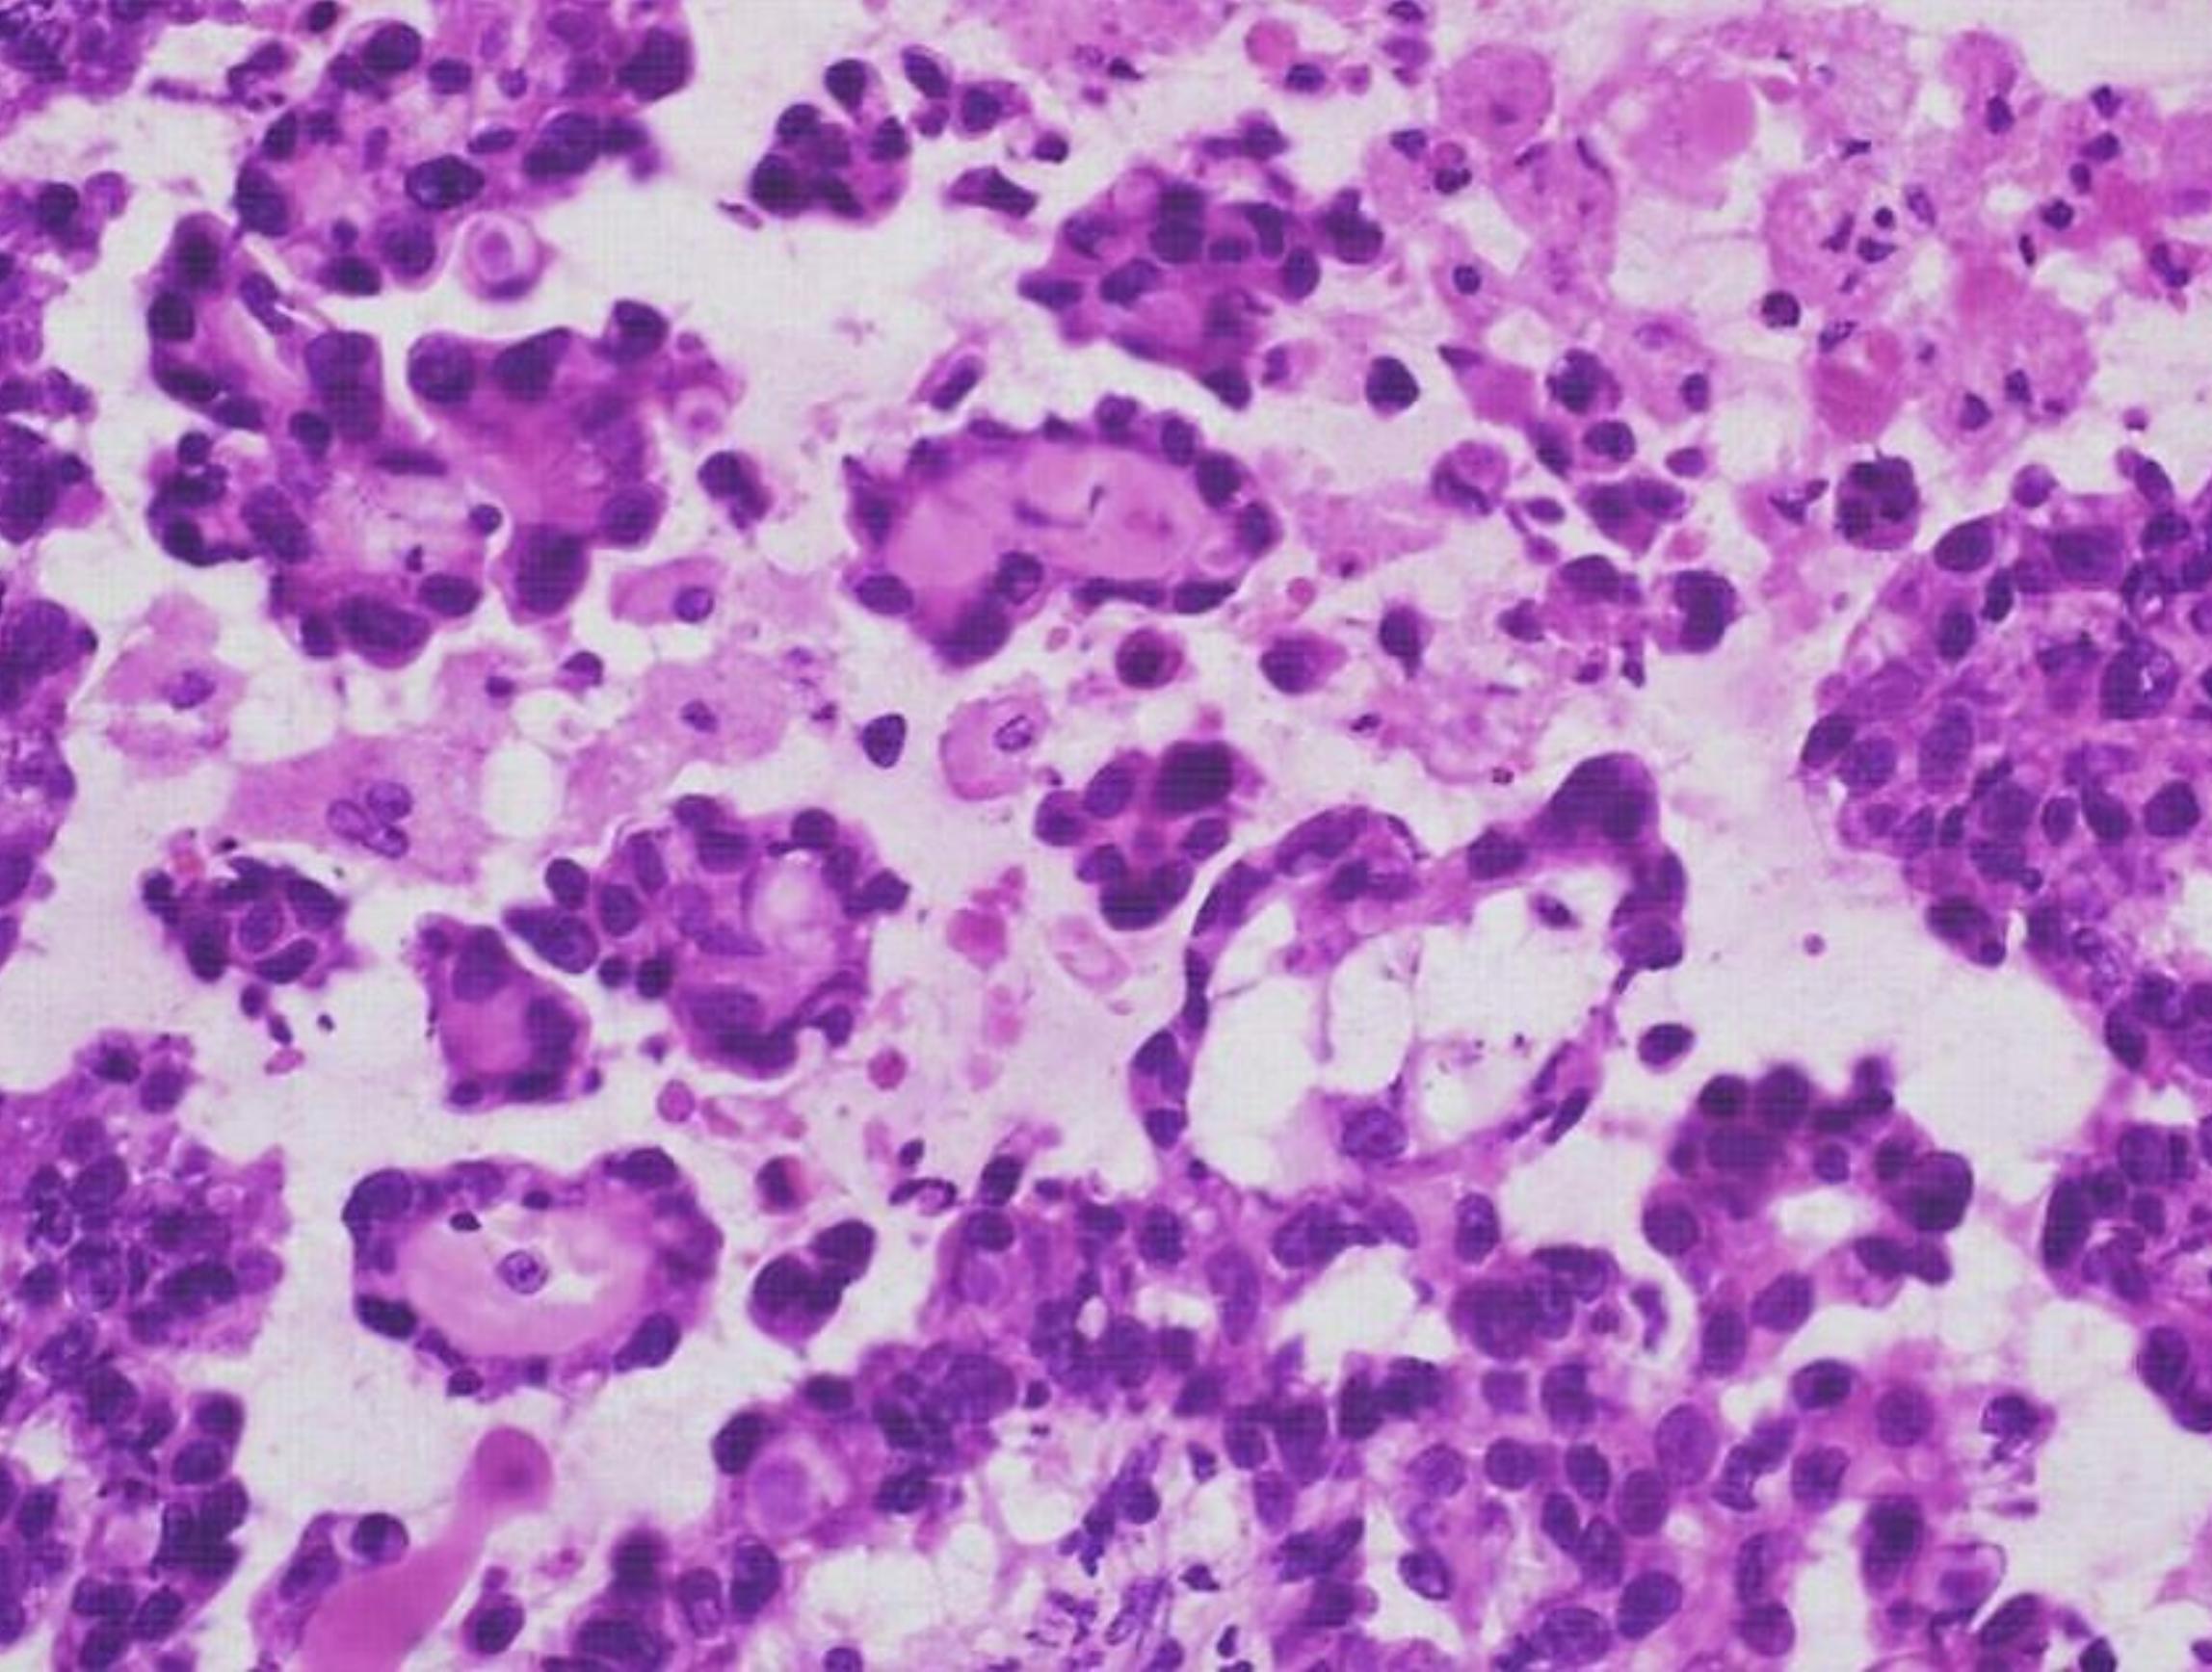

Pitfall #4

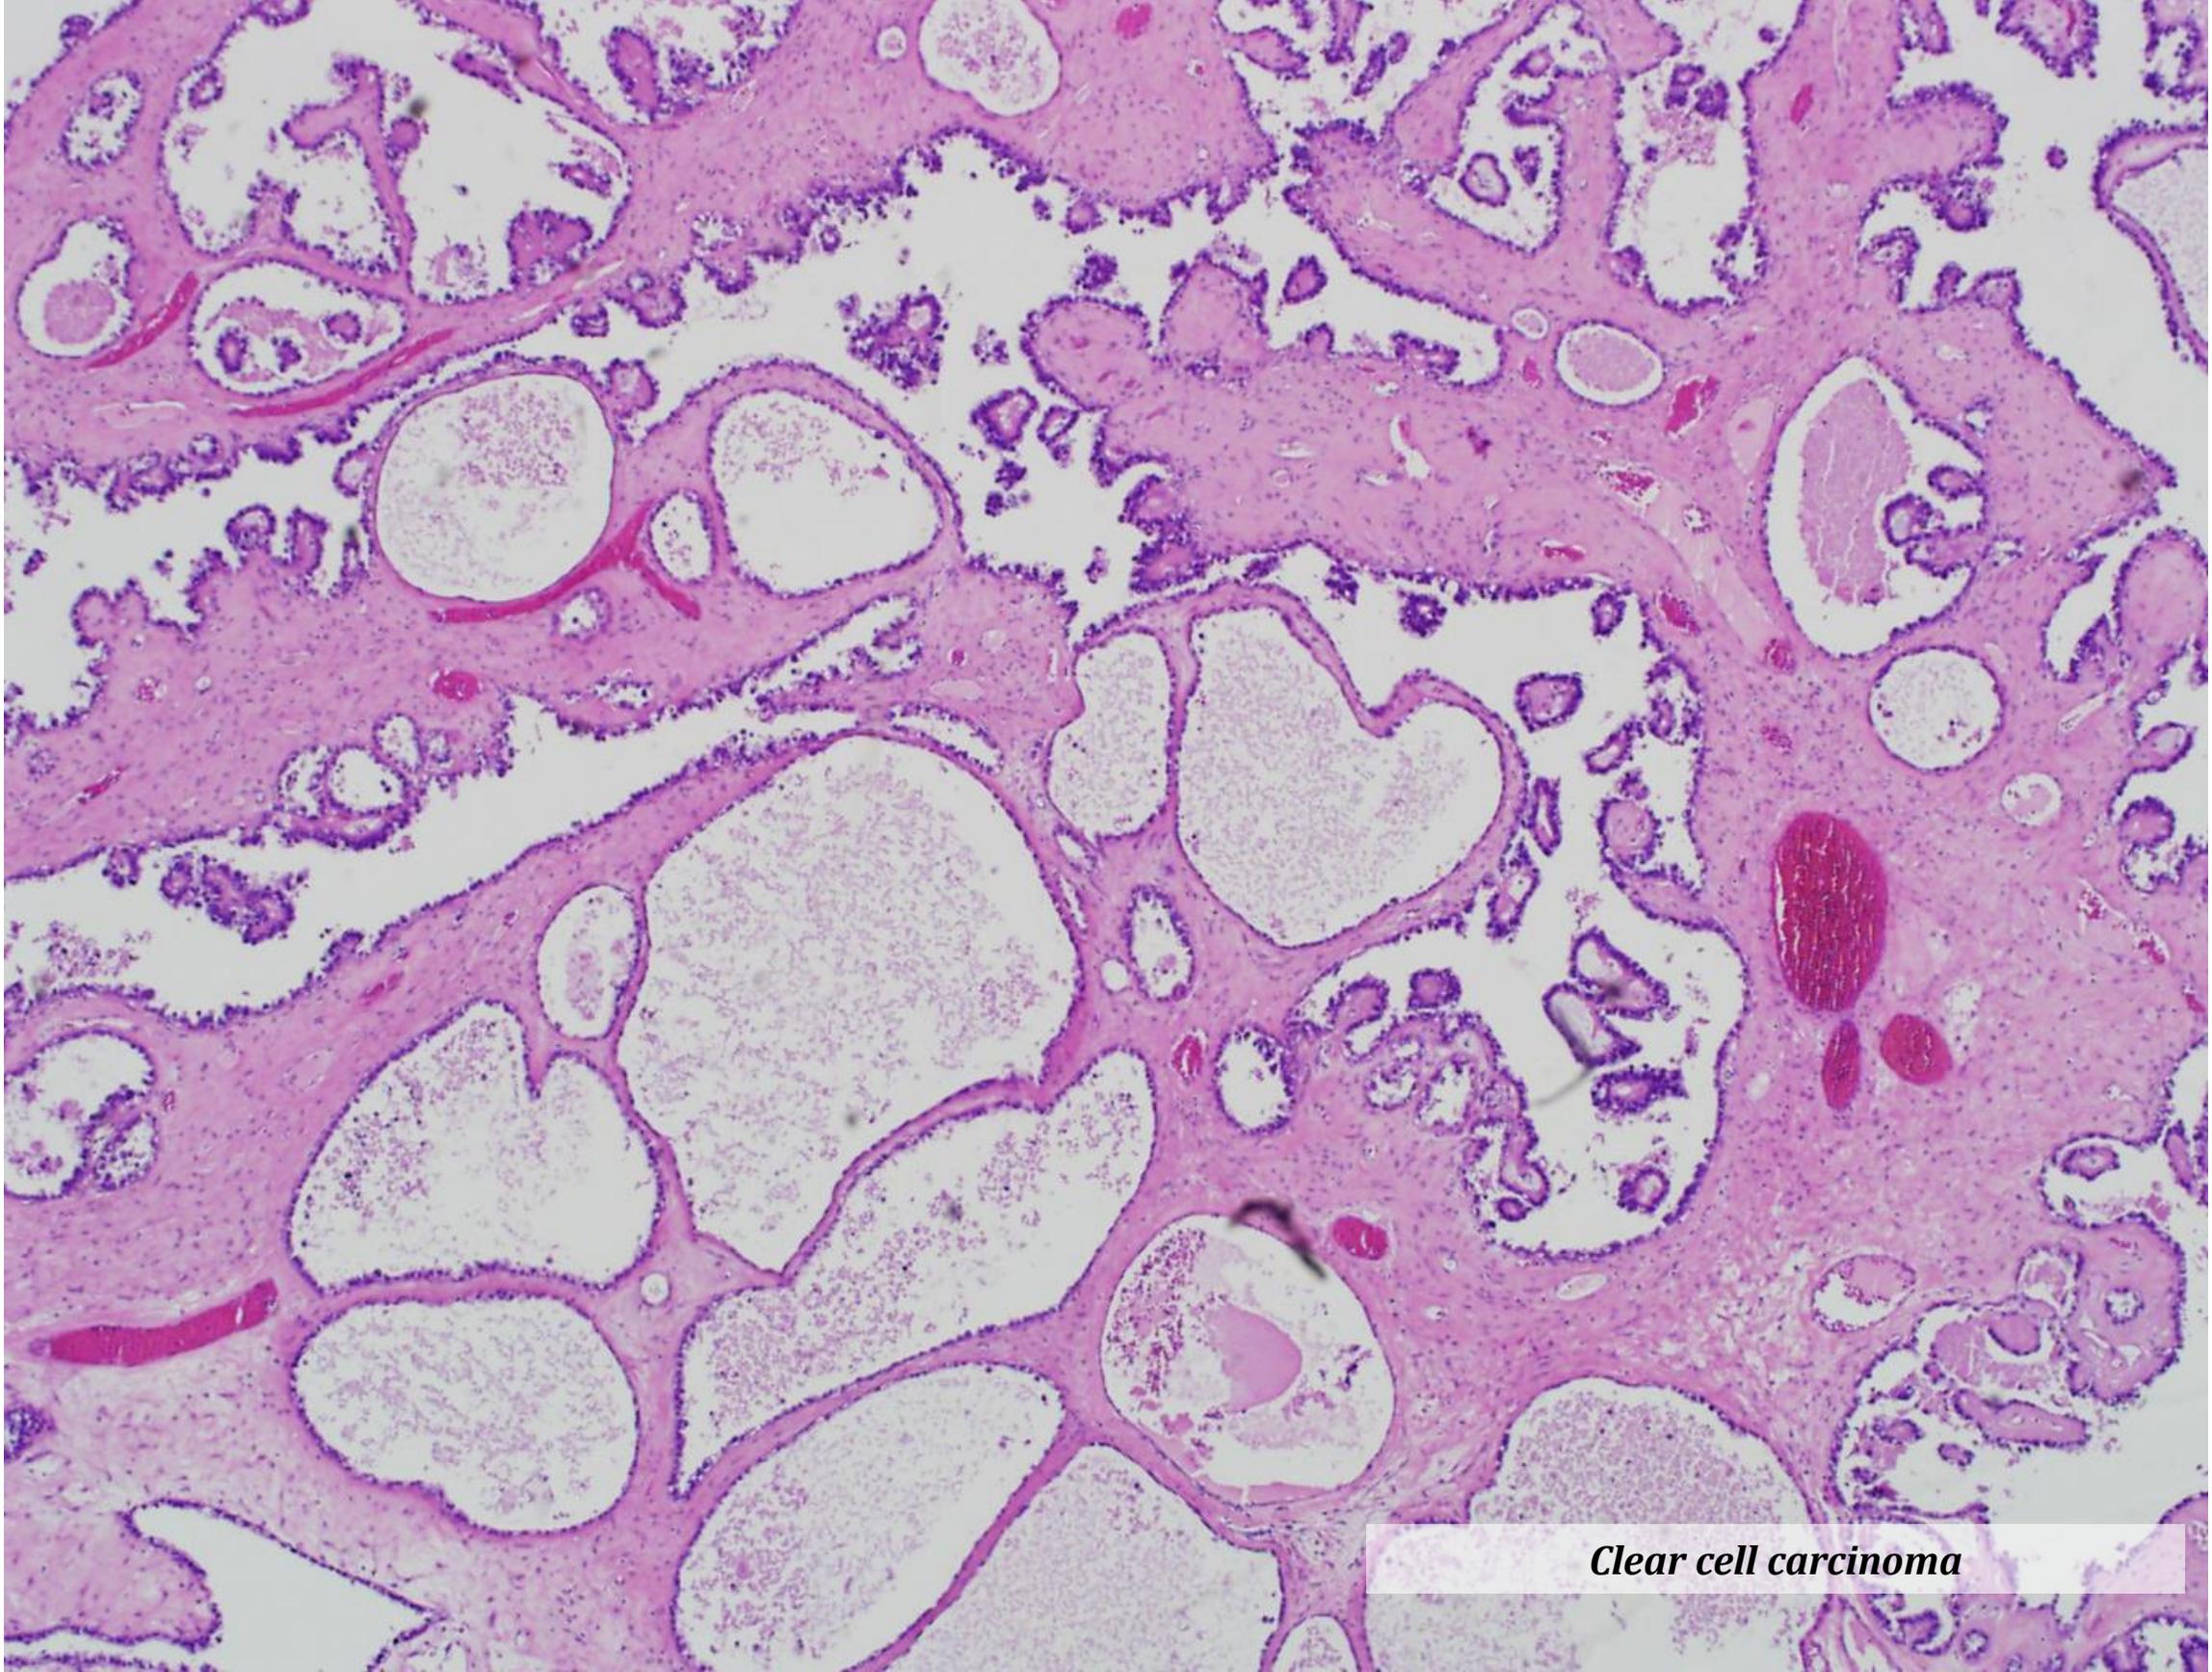

SCENARIO:

Postmenopausal woman with a complex cystic ovarian mass undergoing salpingo-oophorectomy. Frozen section requested on the ovary.

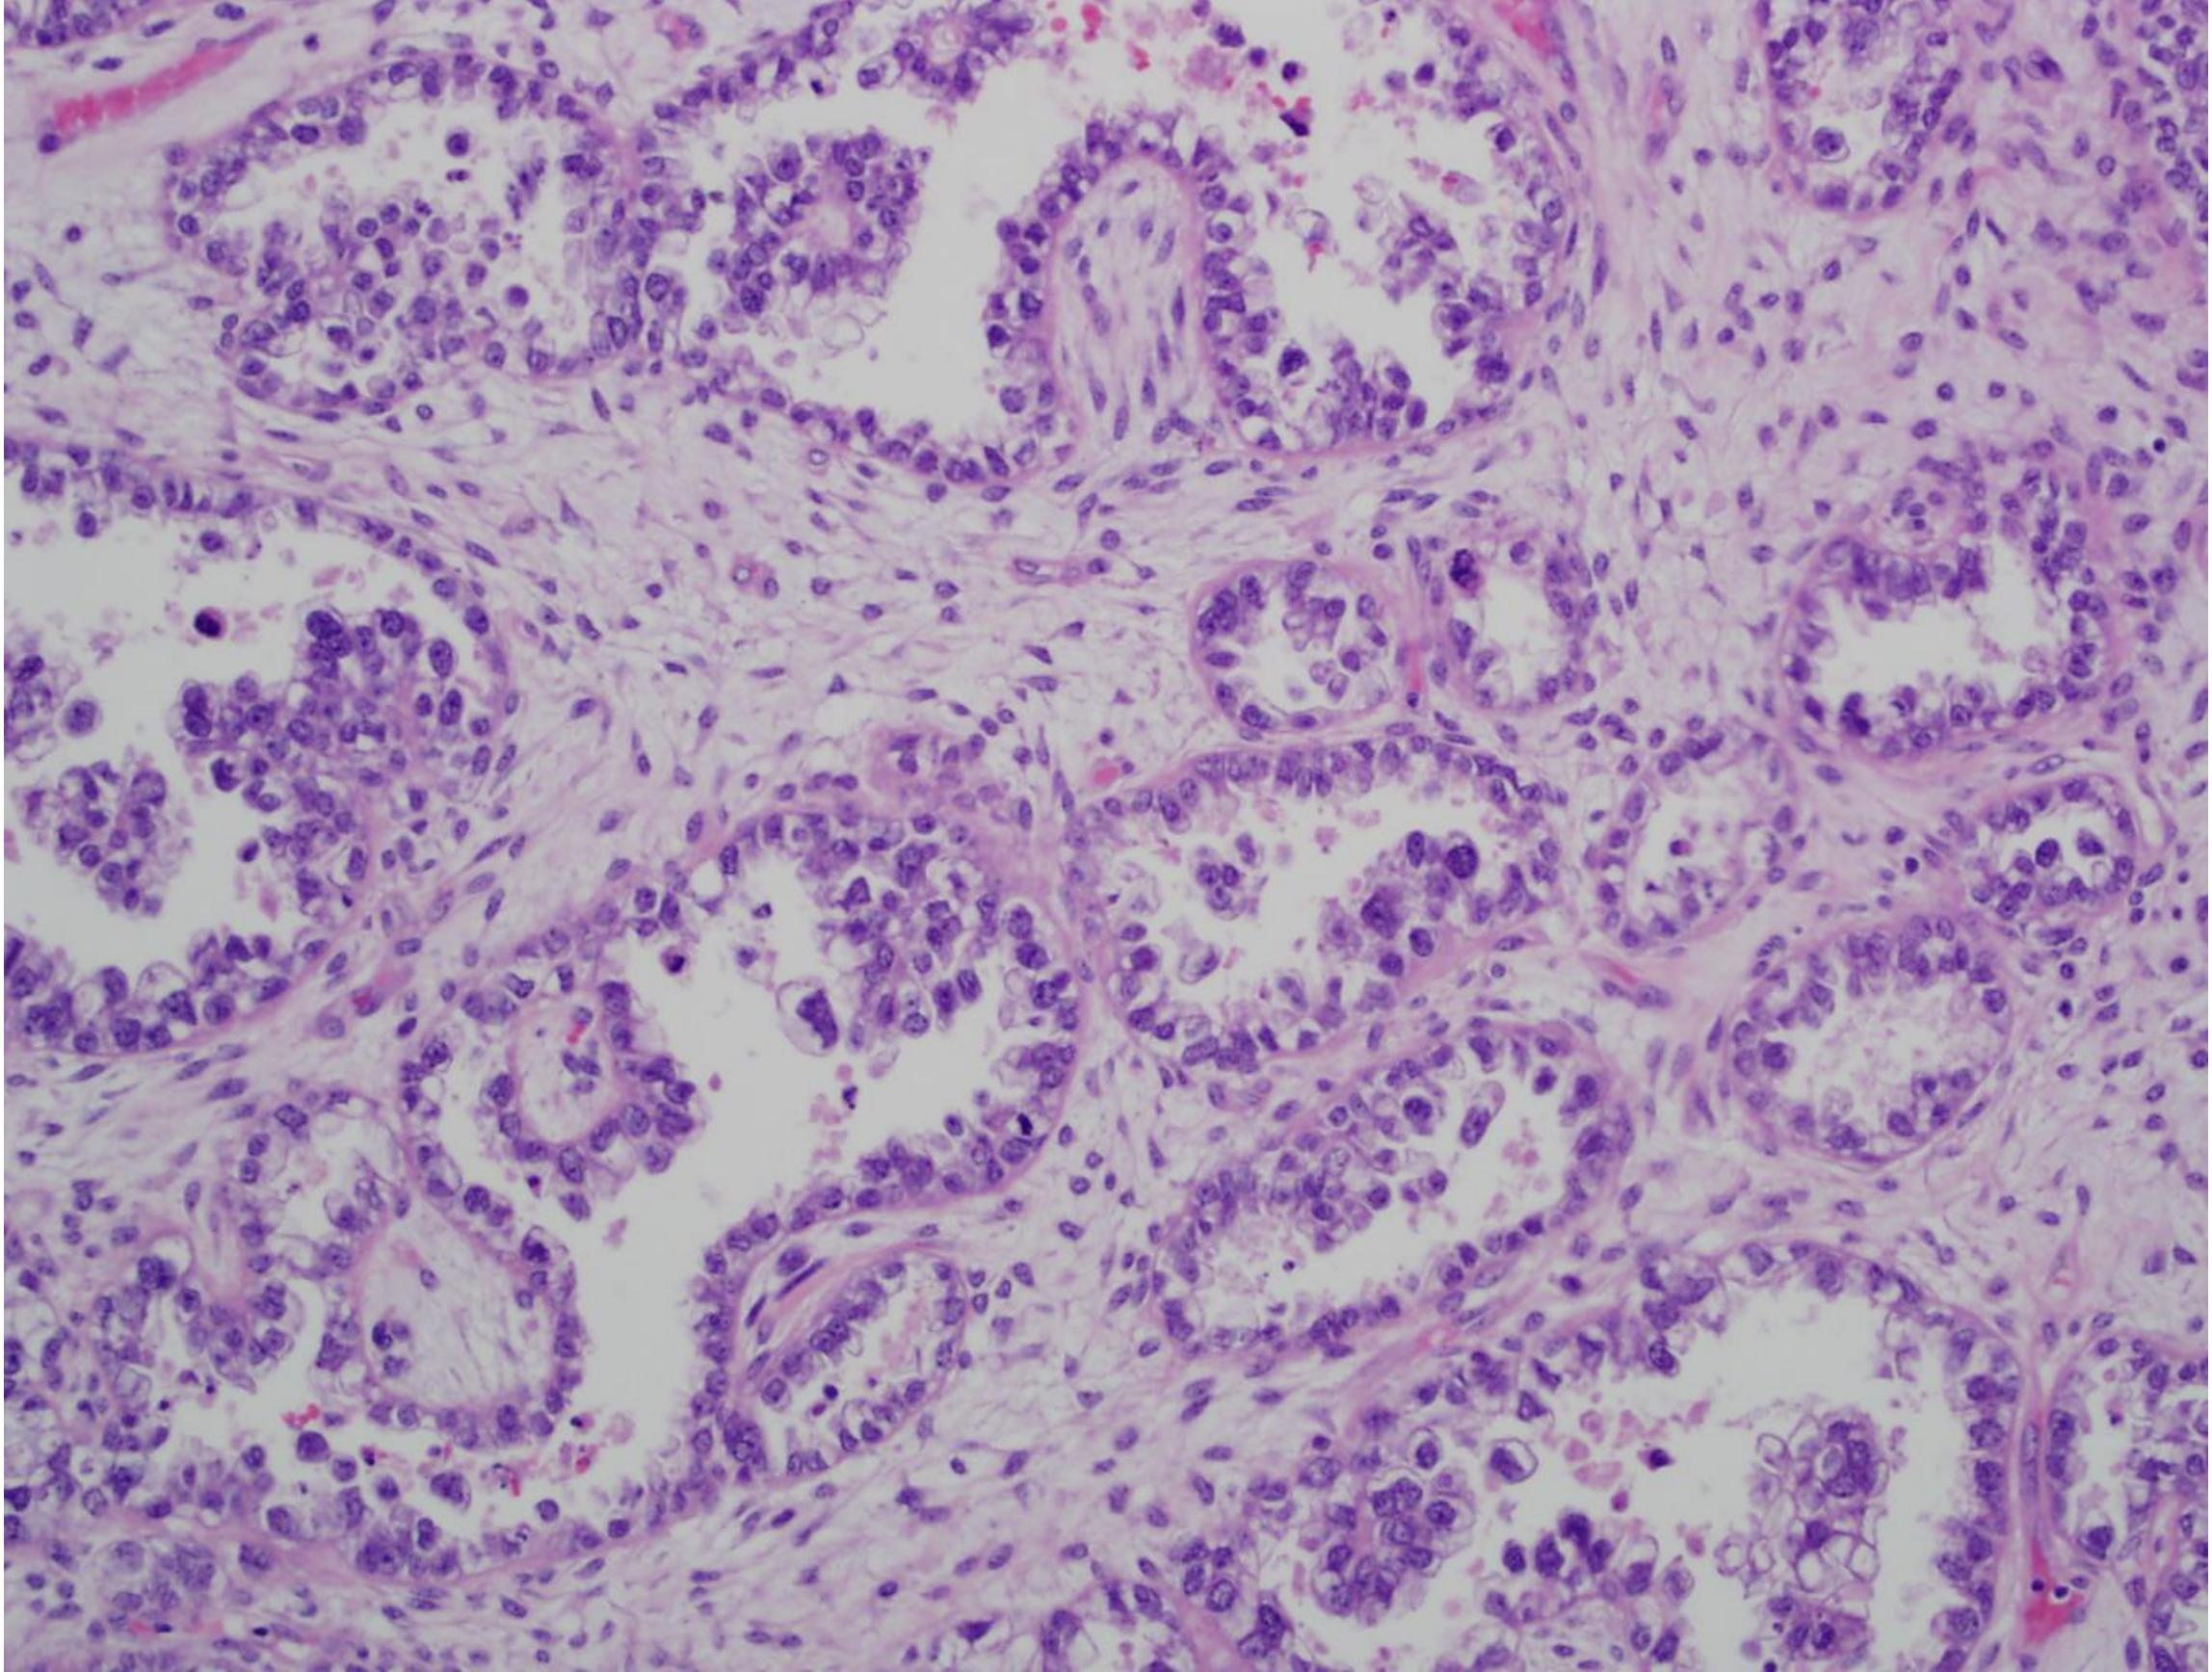

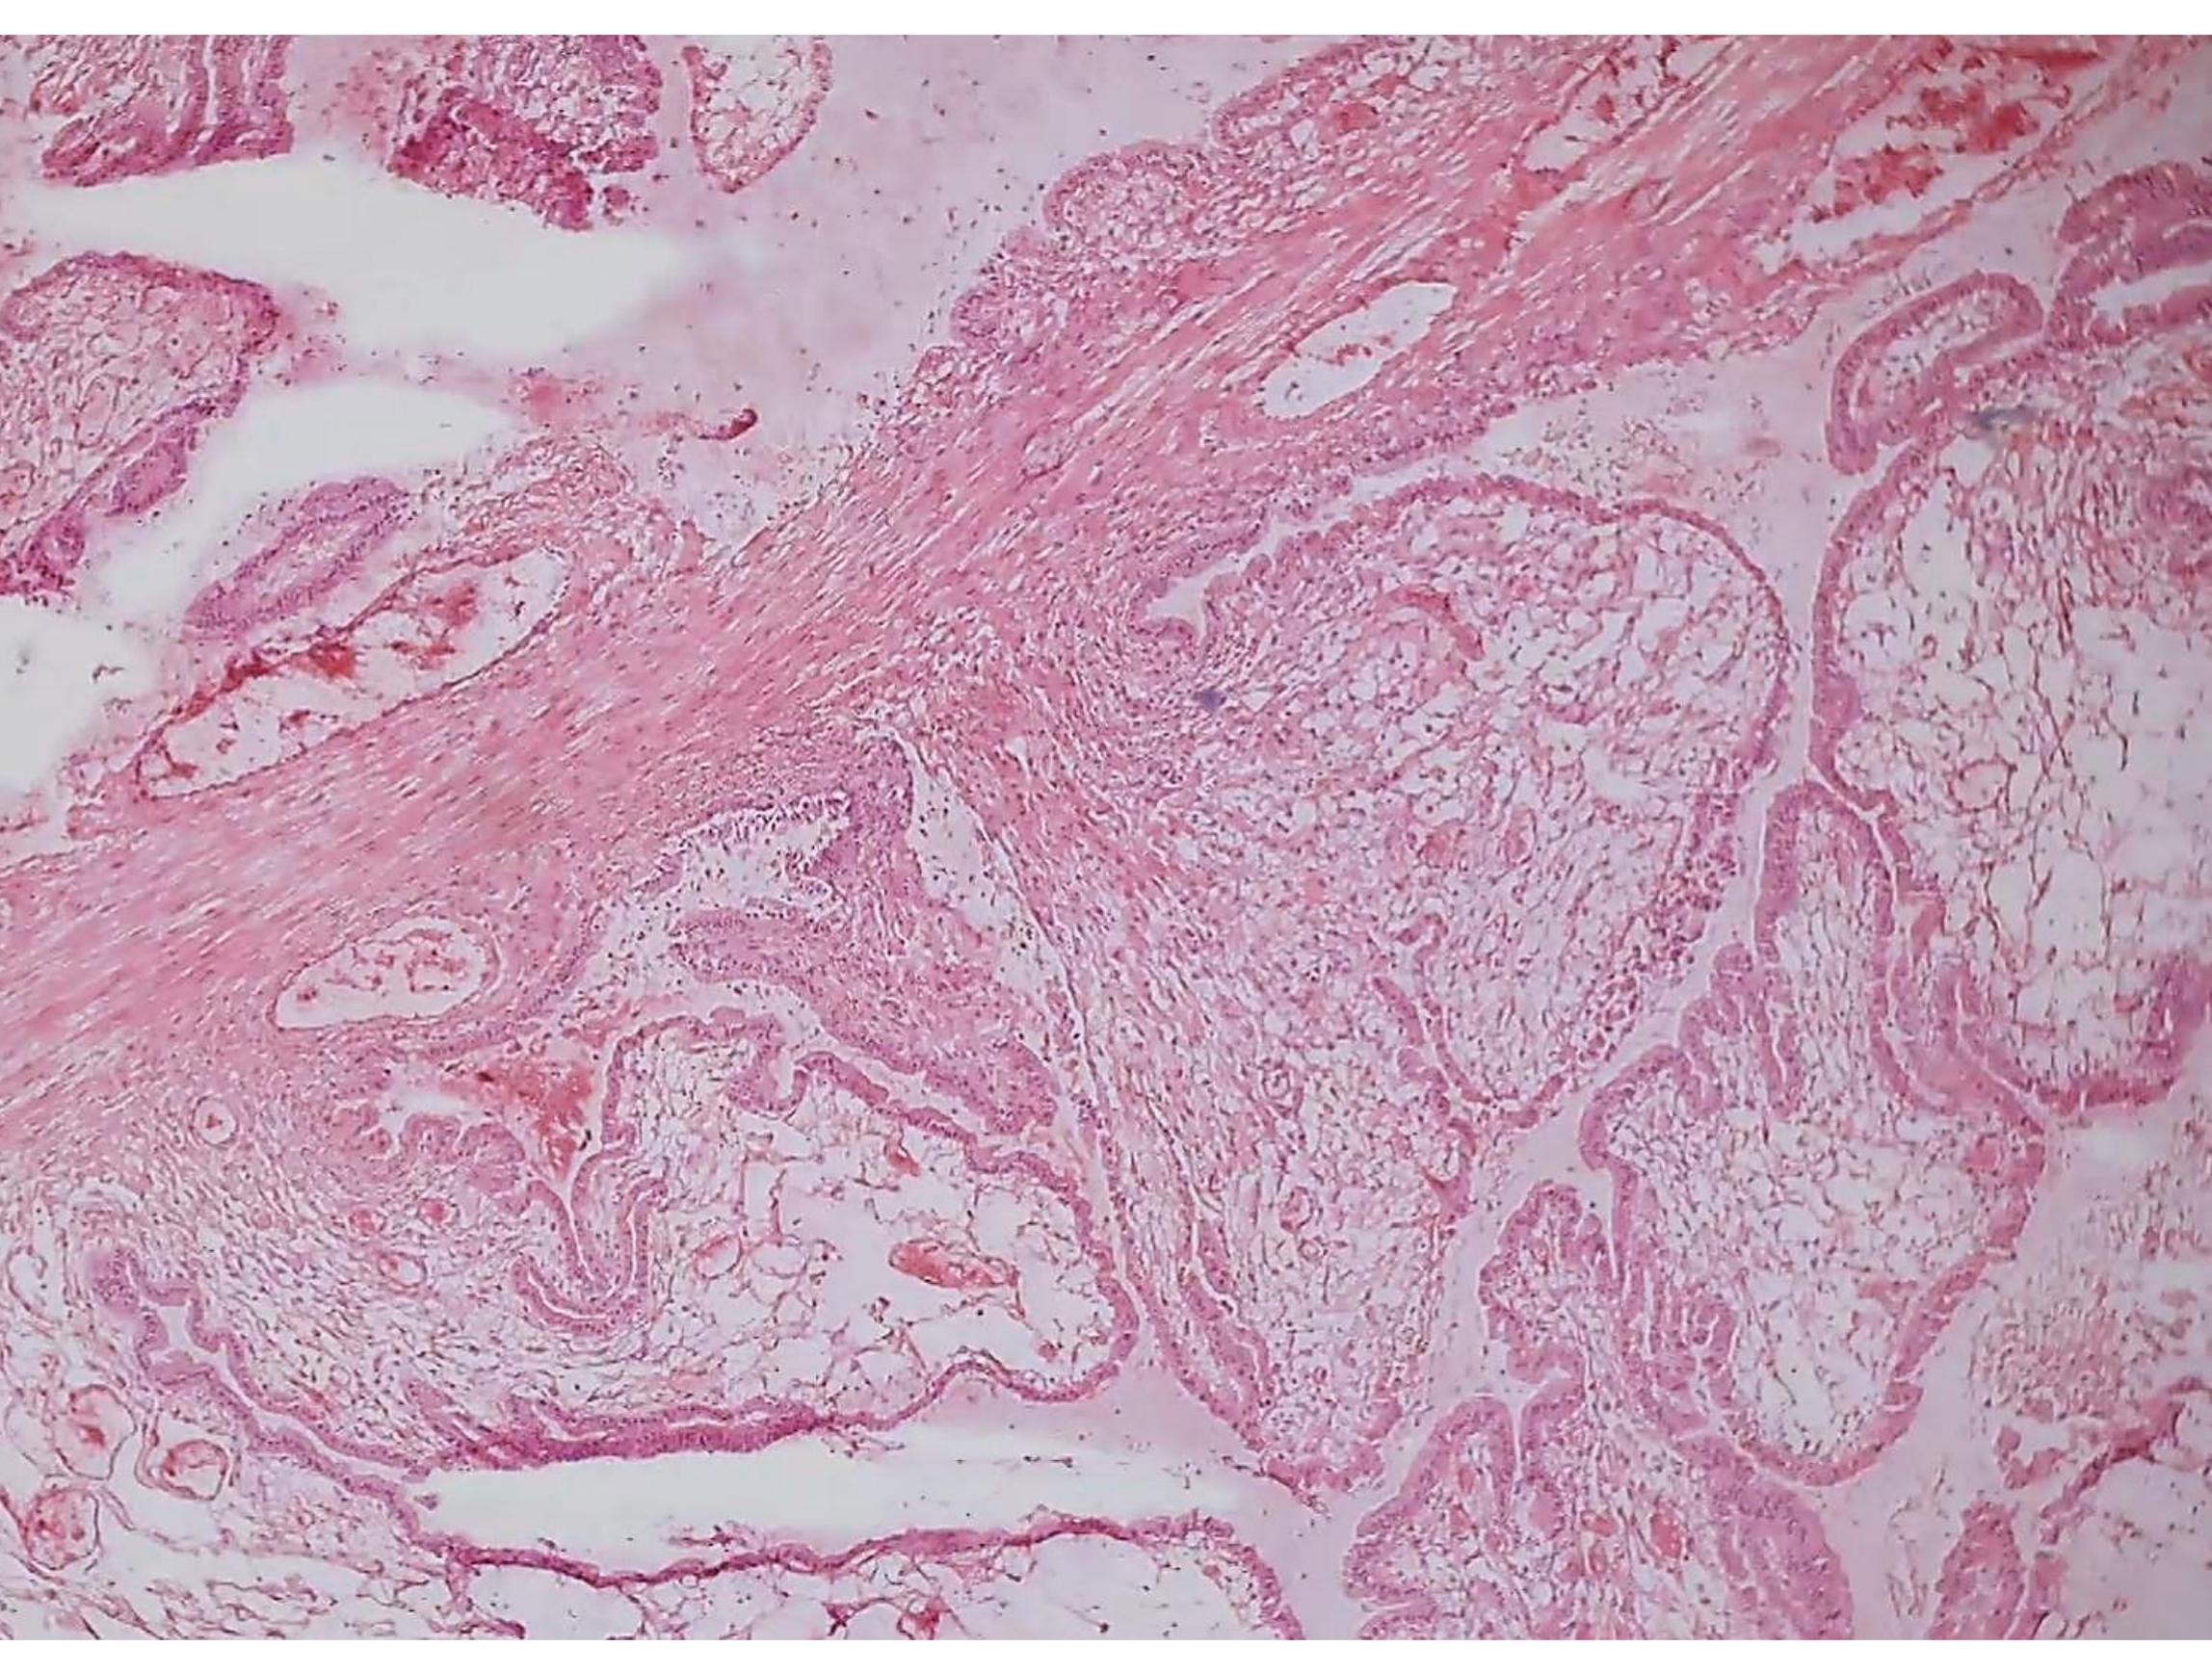

Clear cell carcinoma

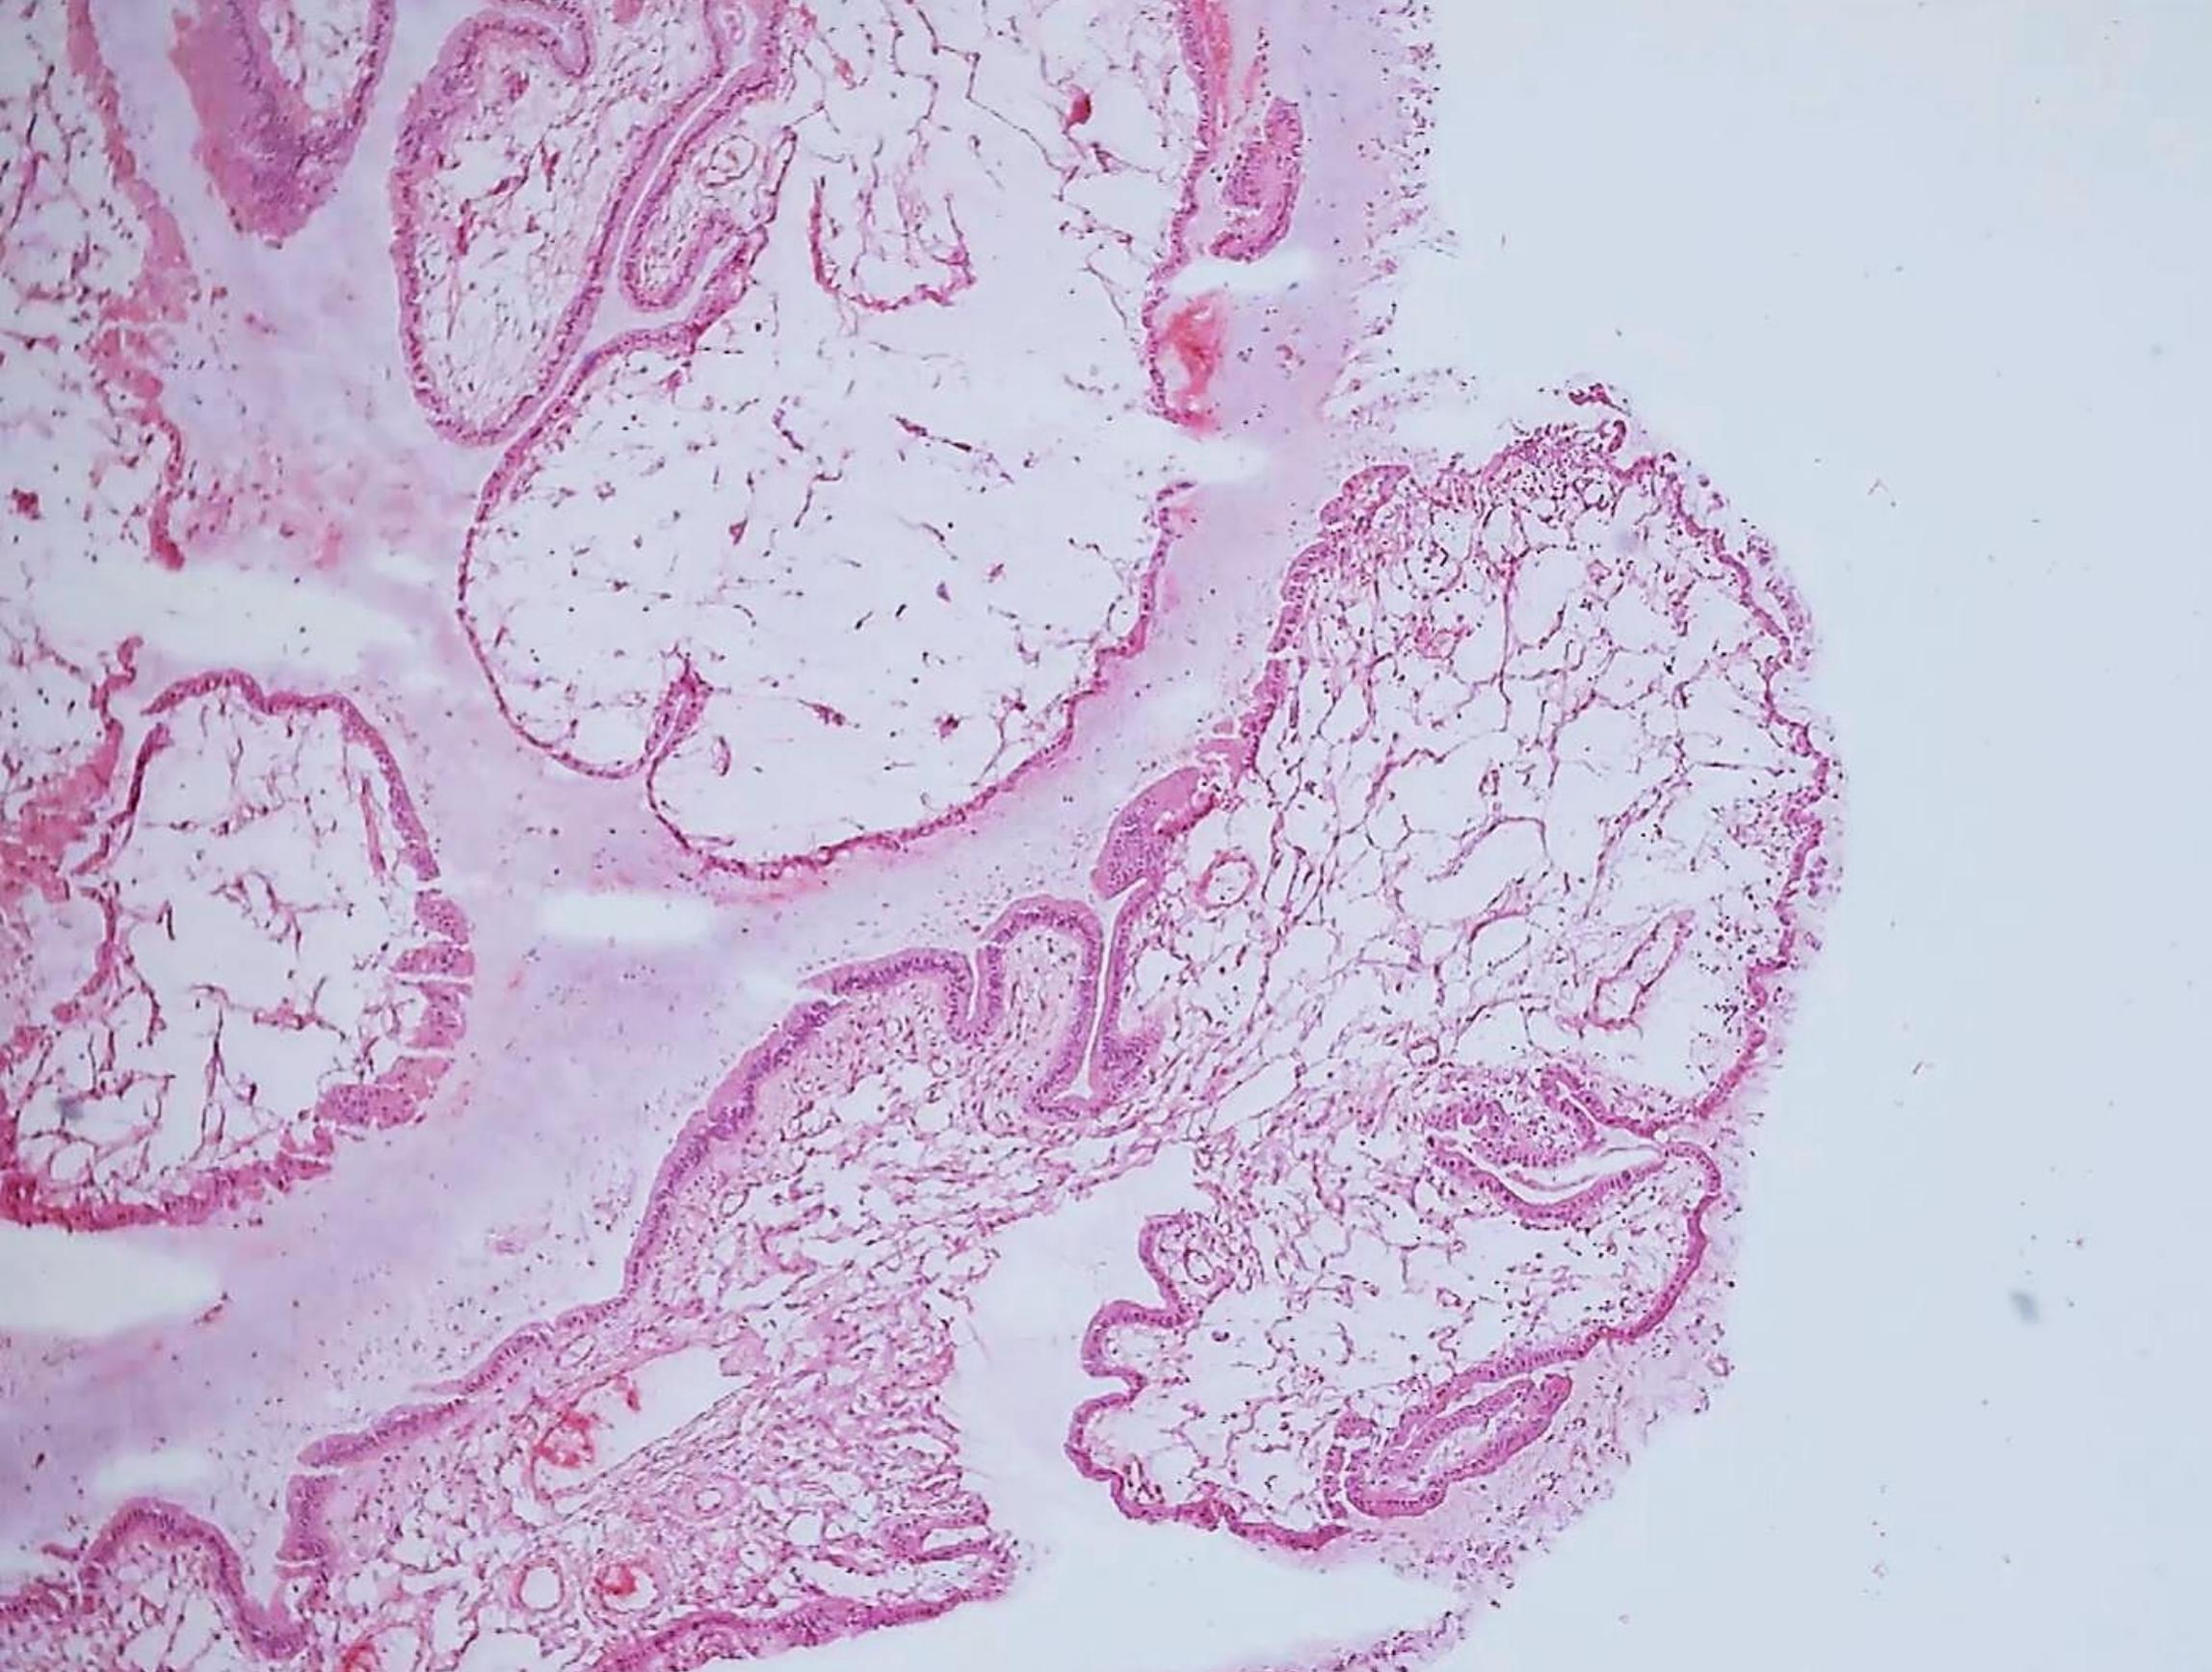

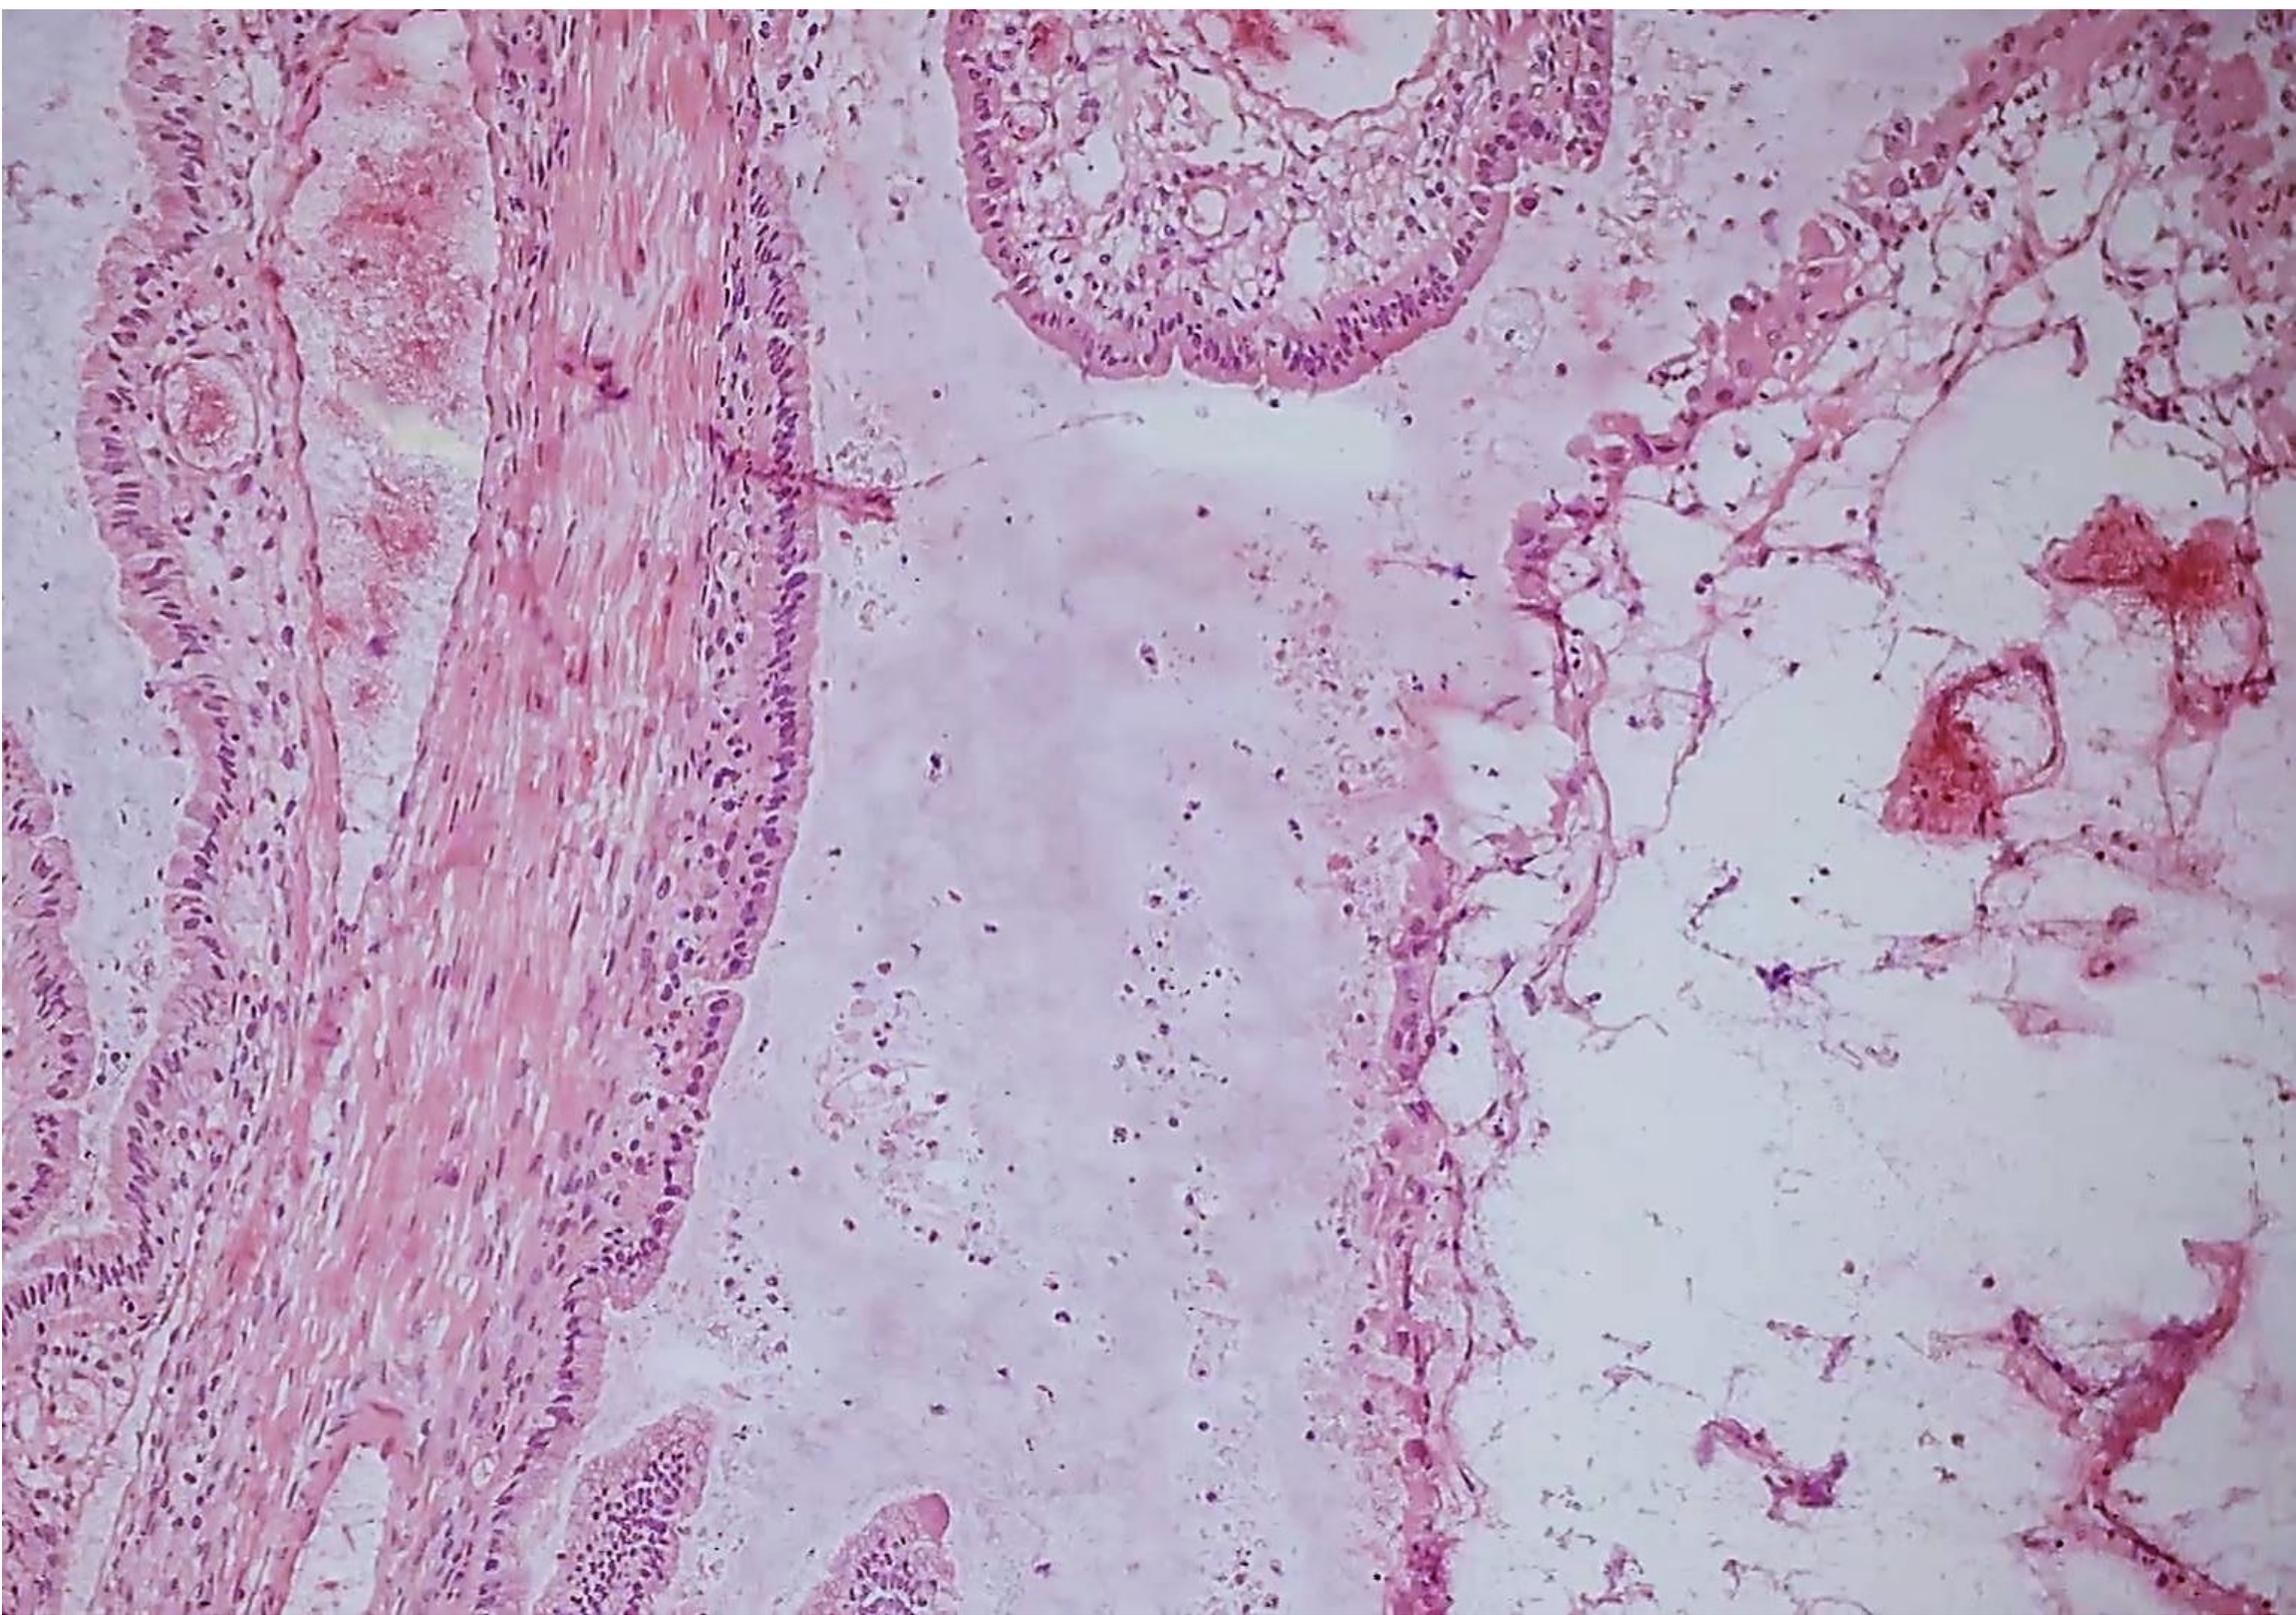

Pitfall #5

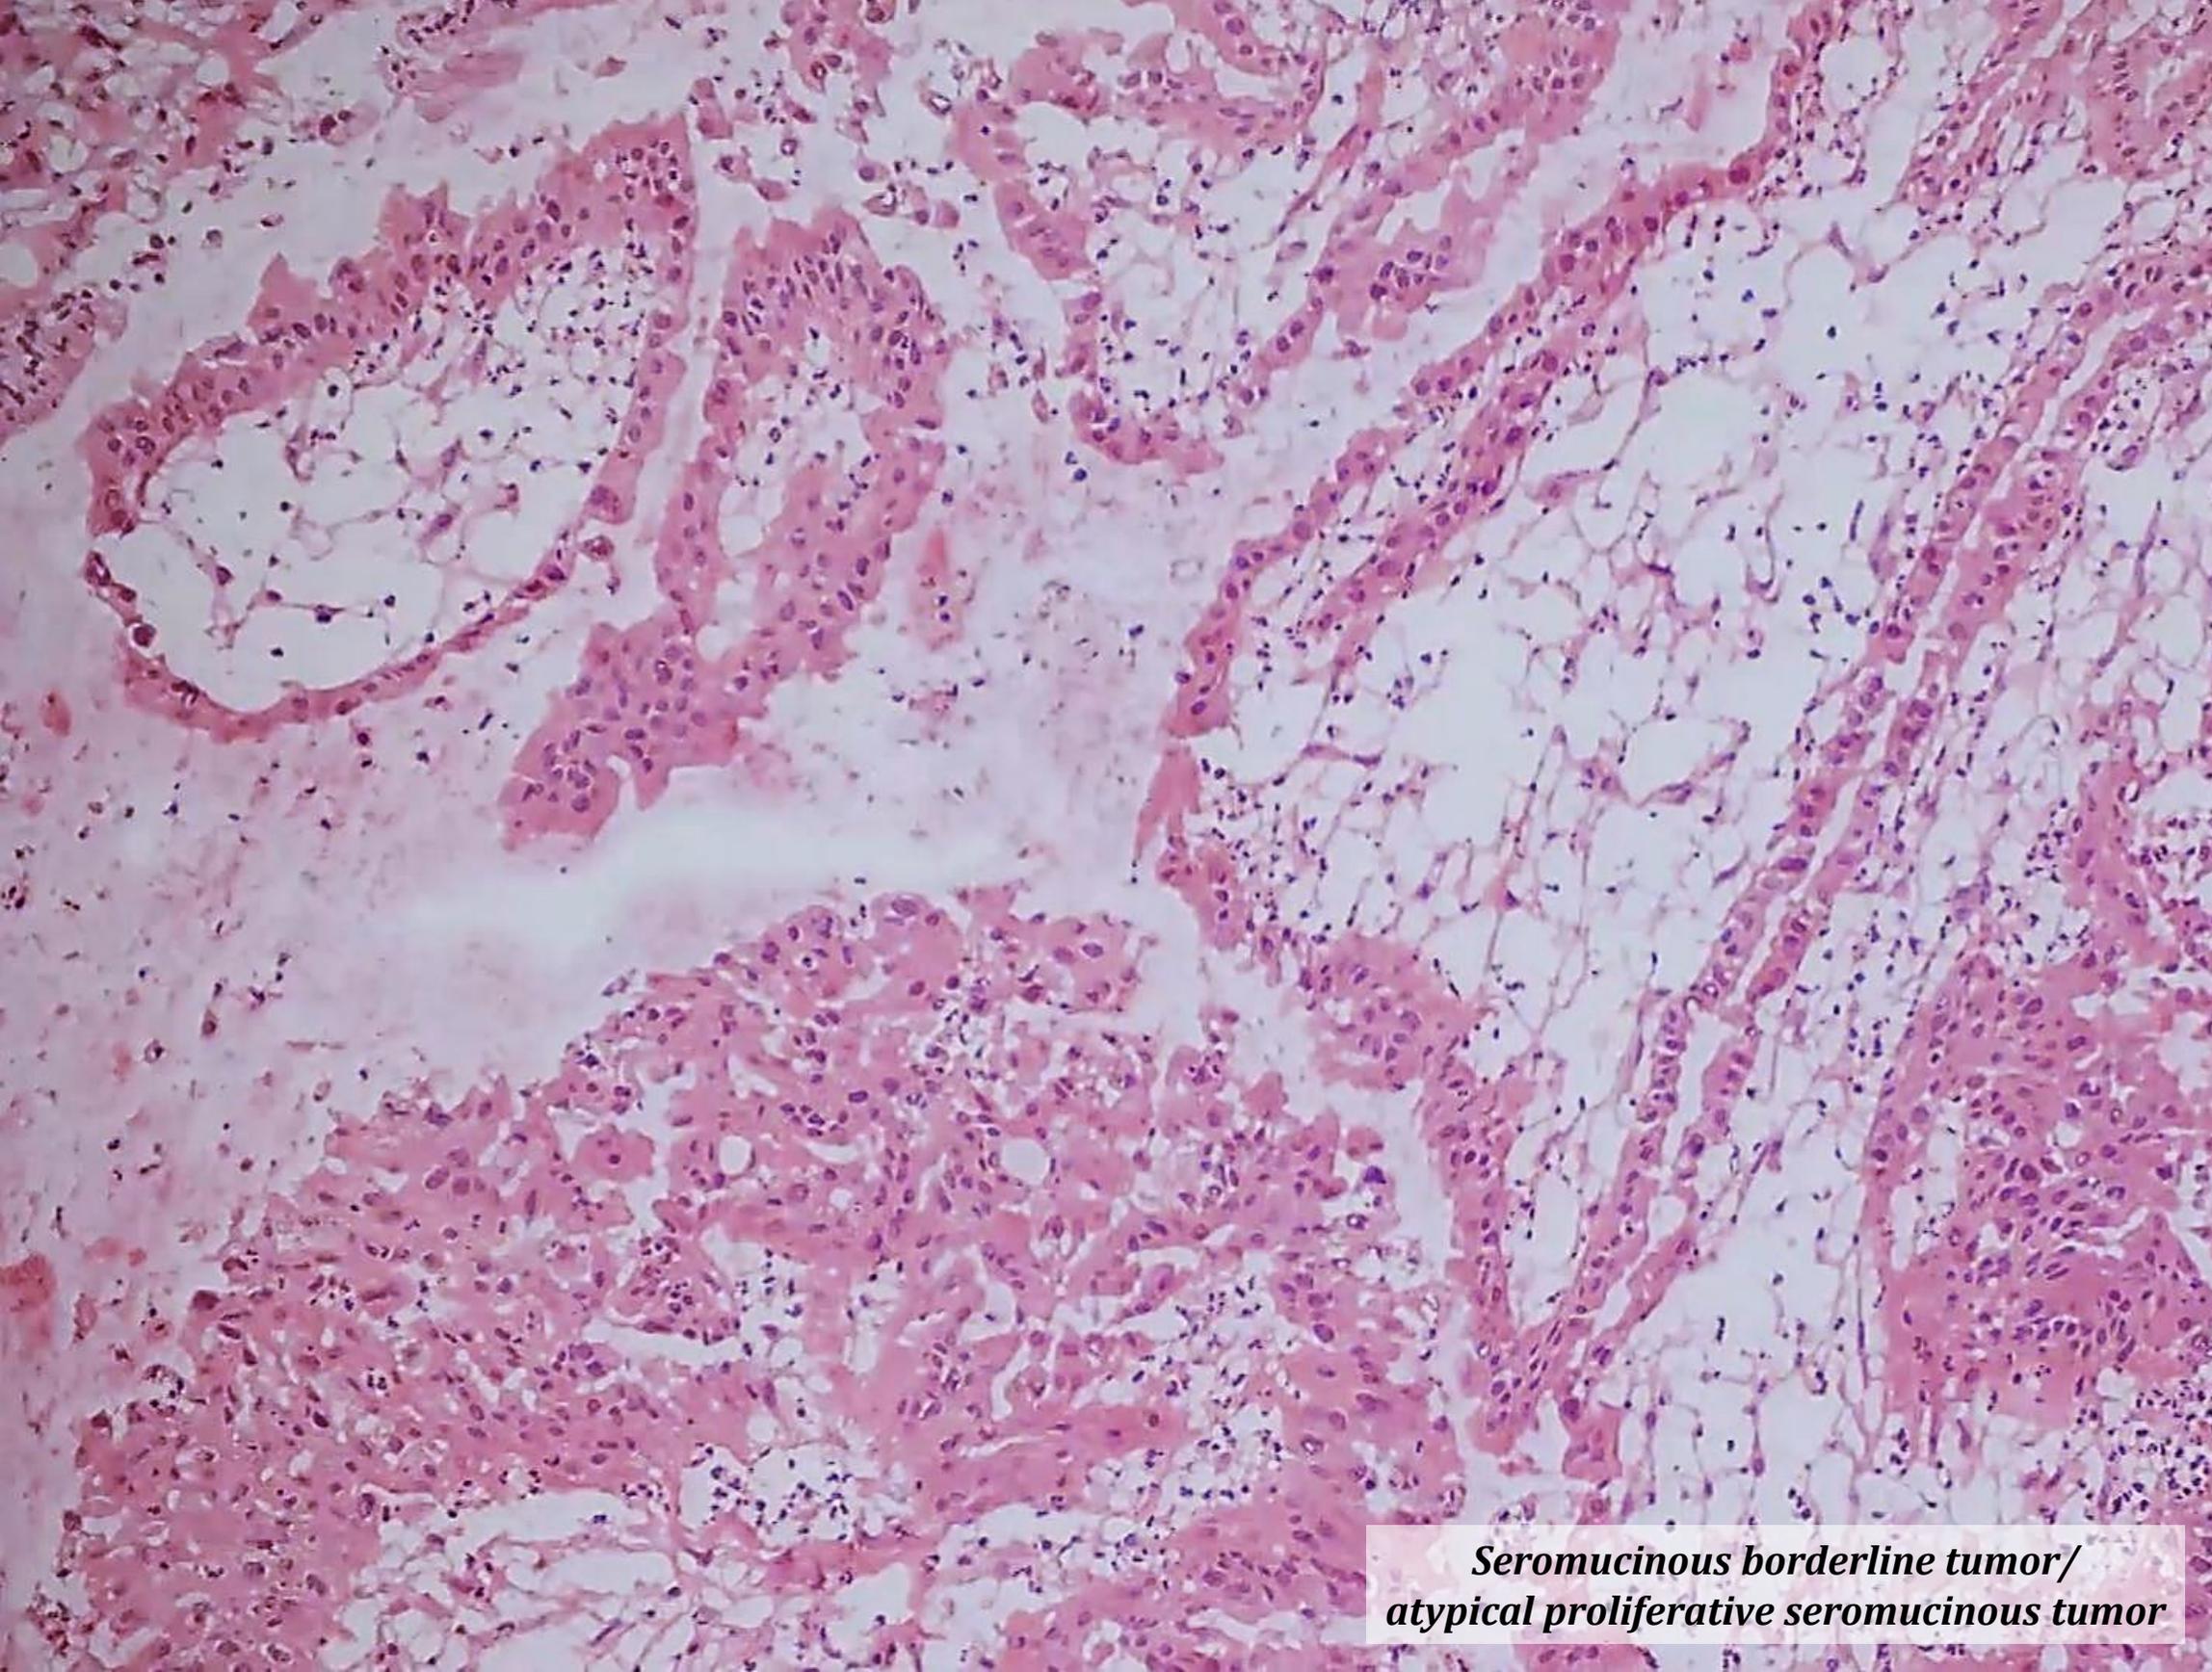

SCENARIO

Premenopausal female with a history of endometriosis, presents with a unilateral complex ovarian mass.

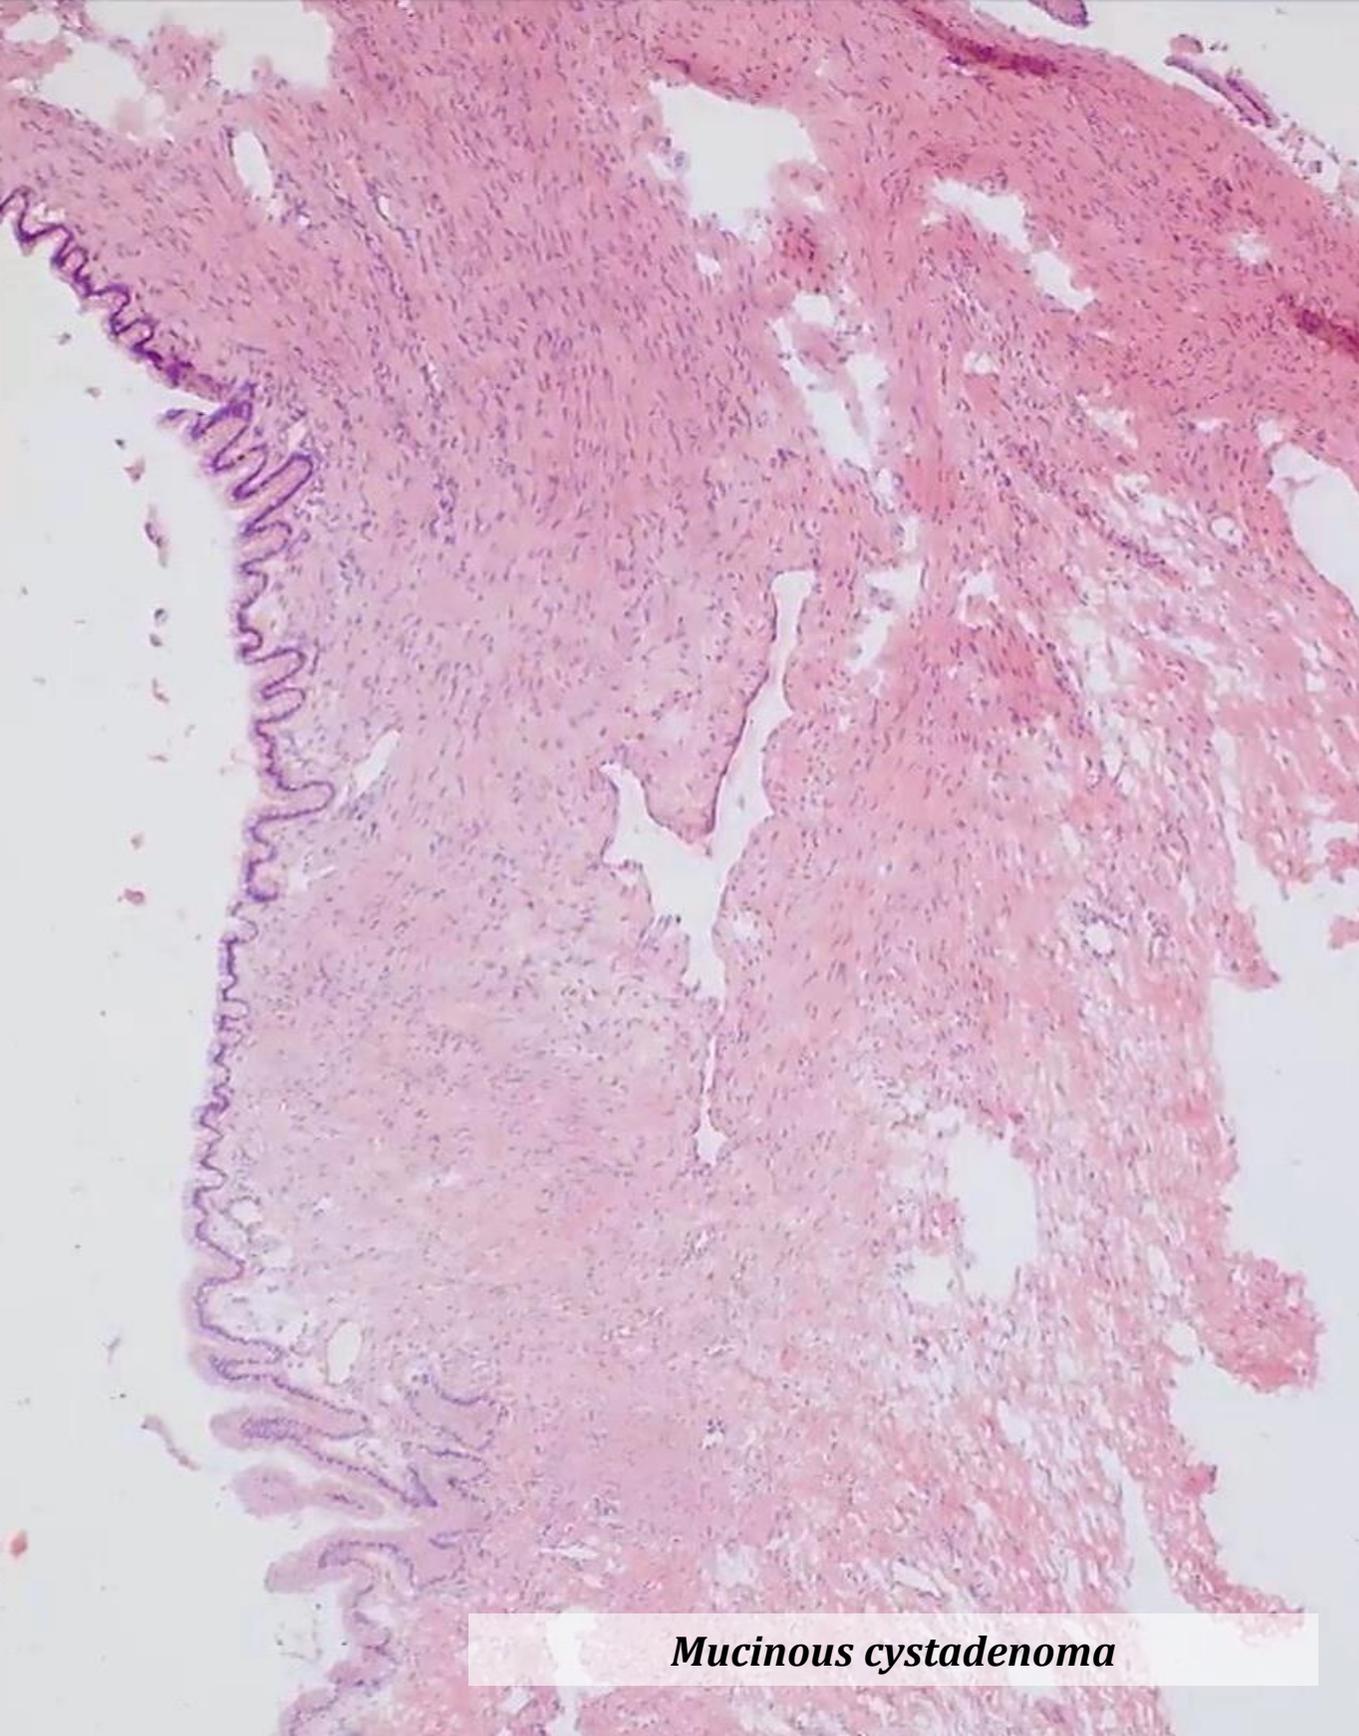

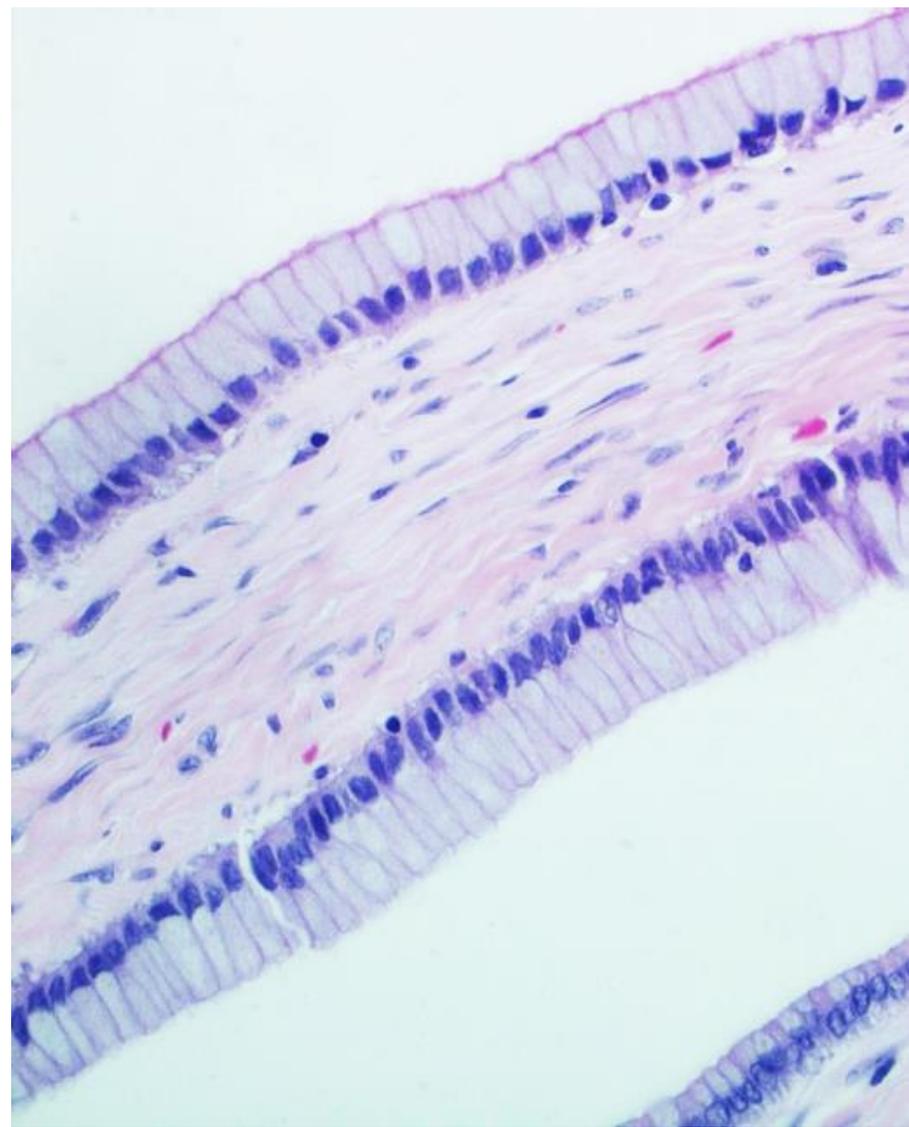

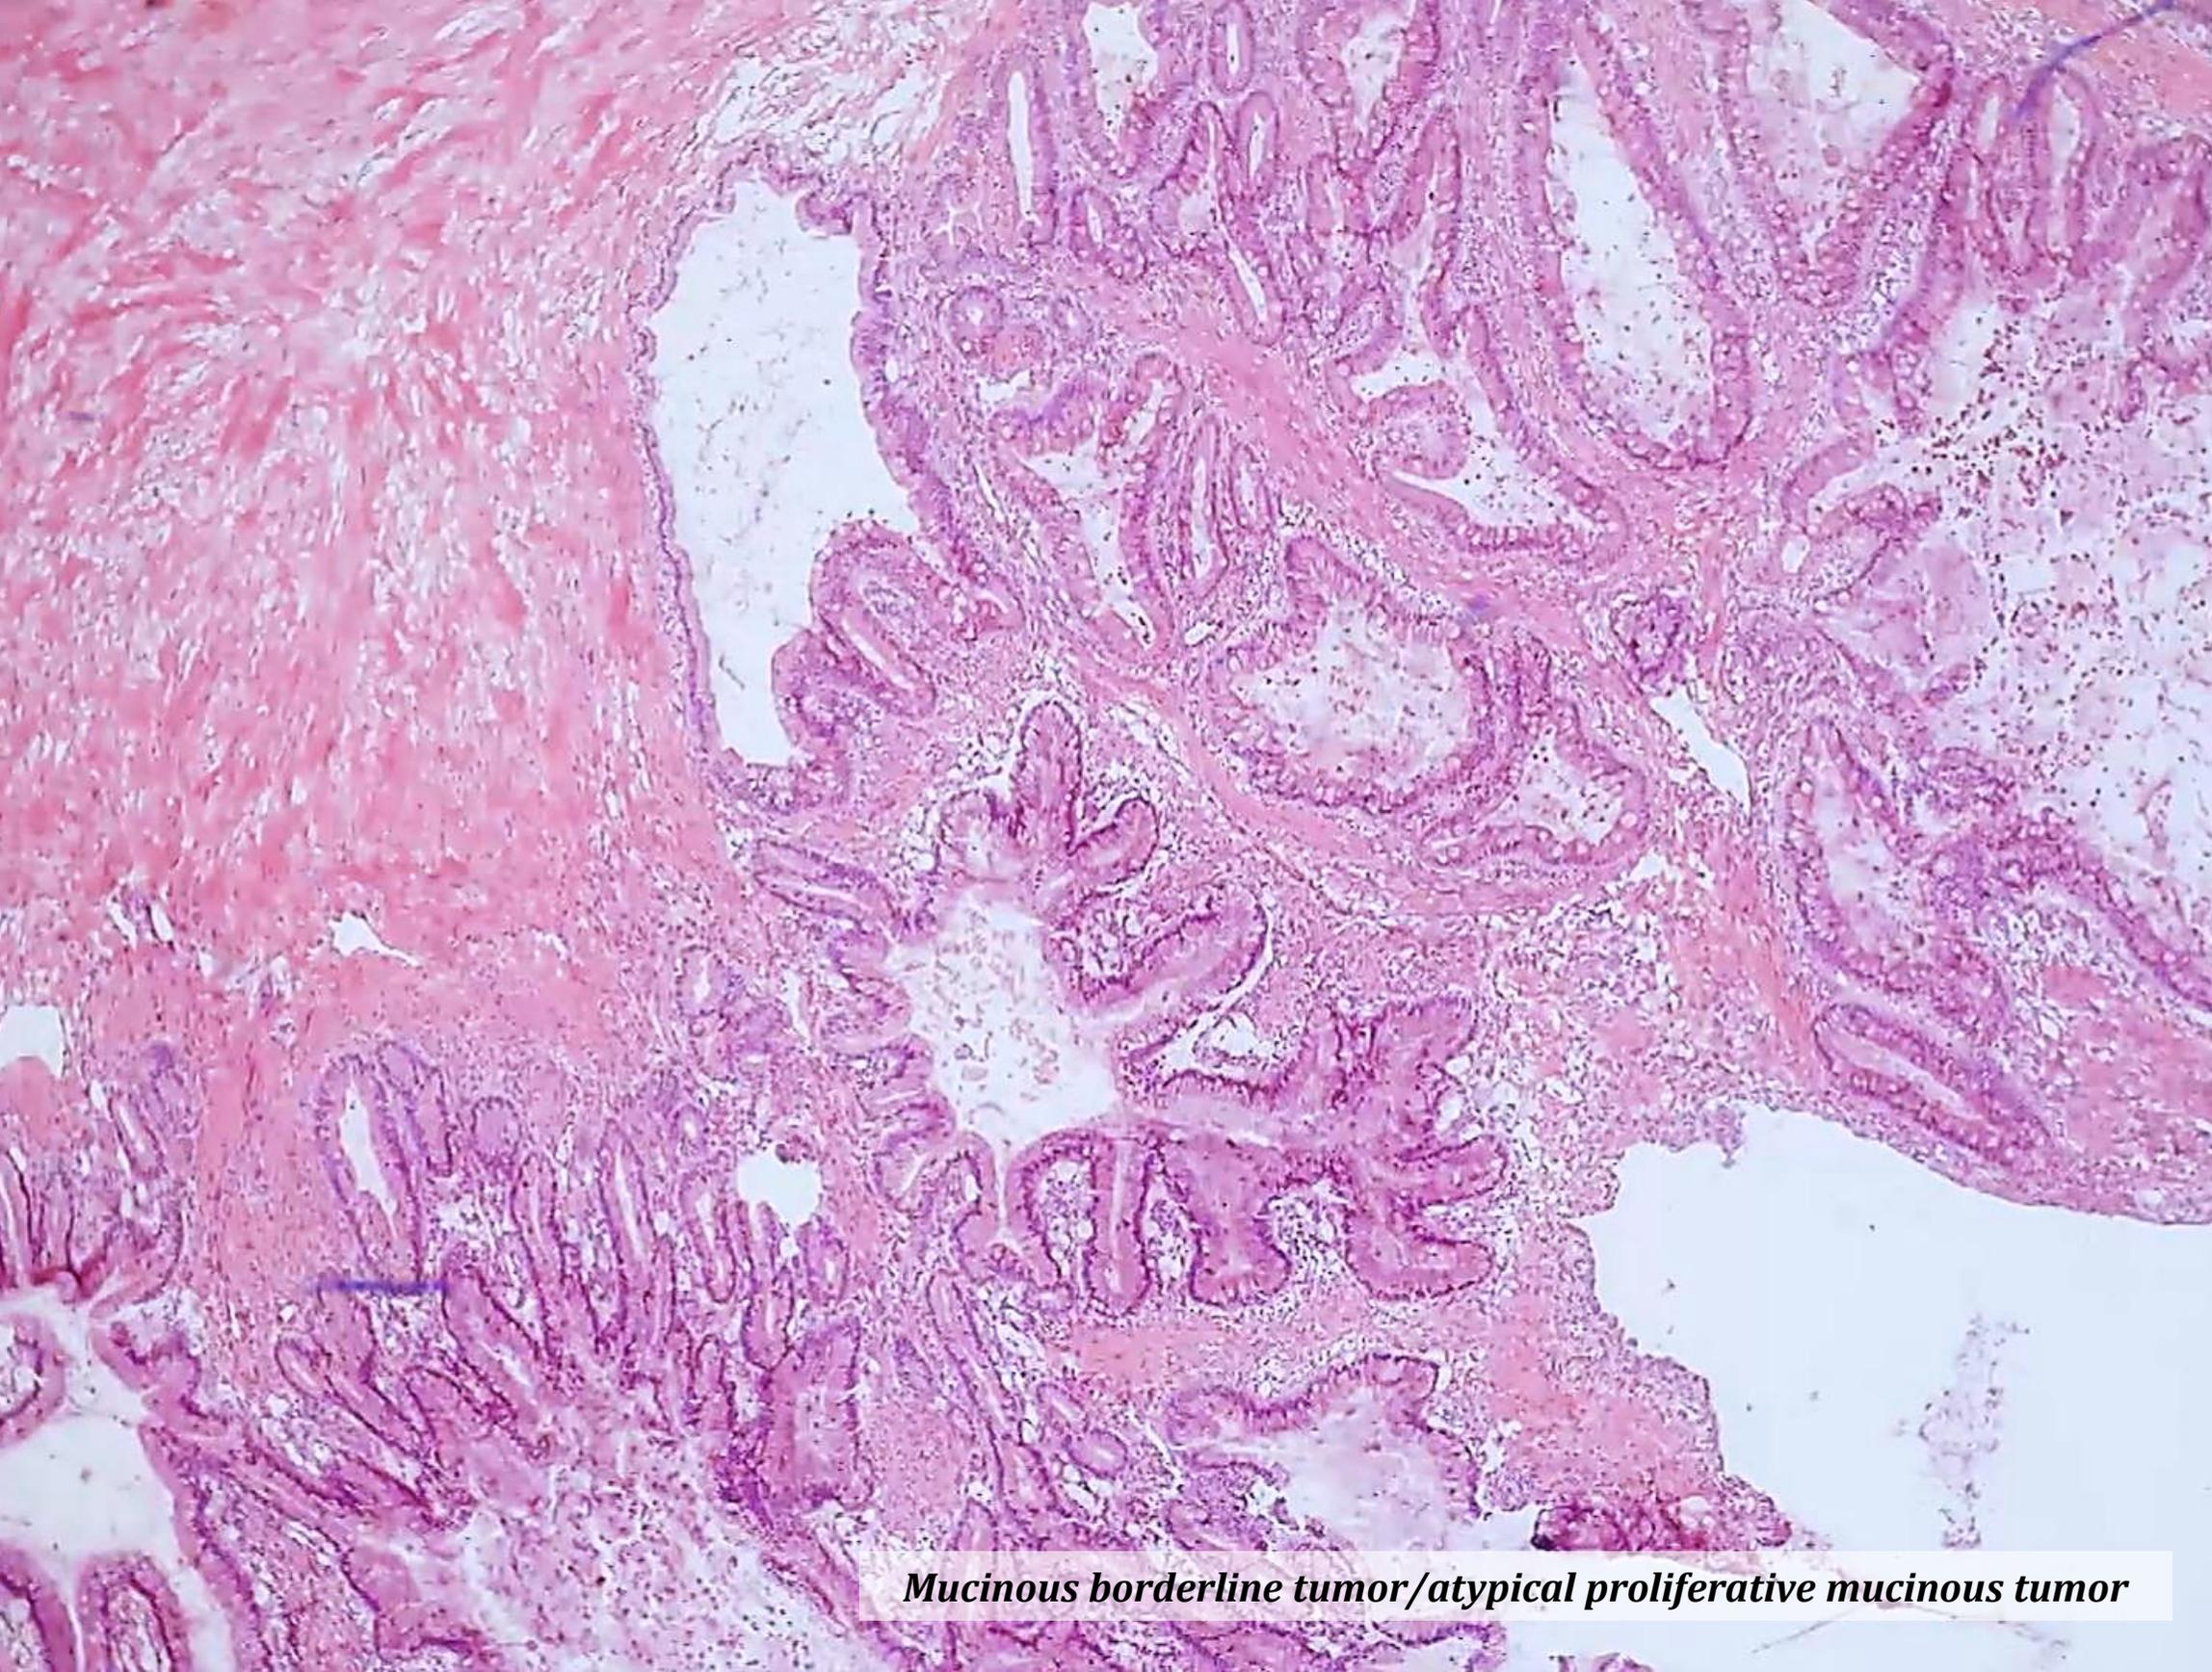

*Seromucinous borderline tumor/
atypical proliferative seromucinous tumor*

*Mucinous
Neoplasms*

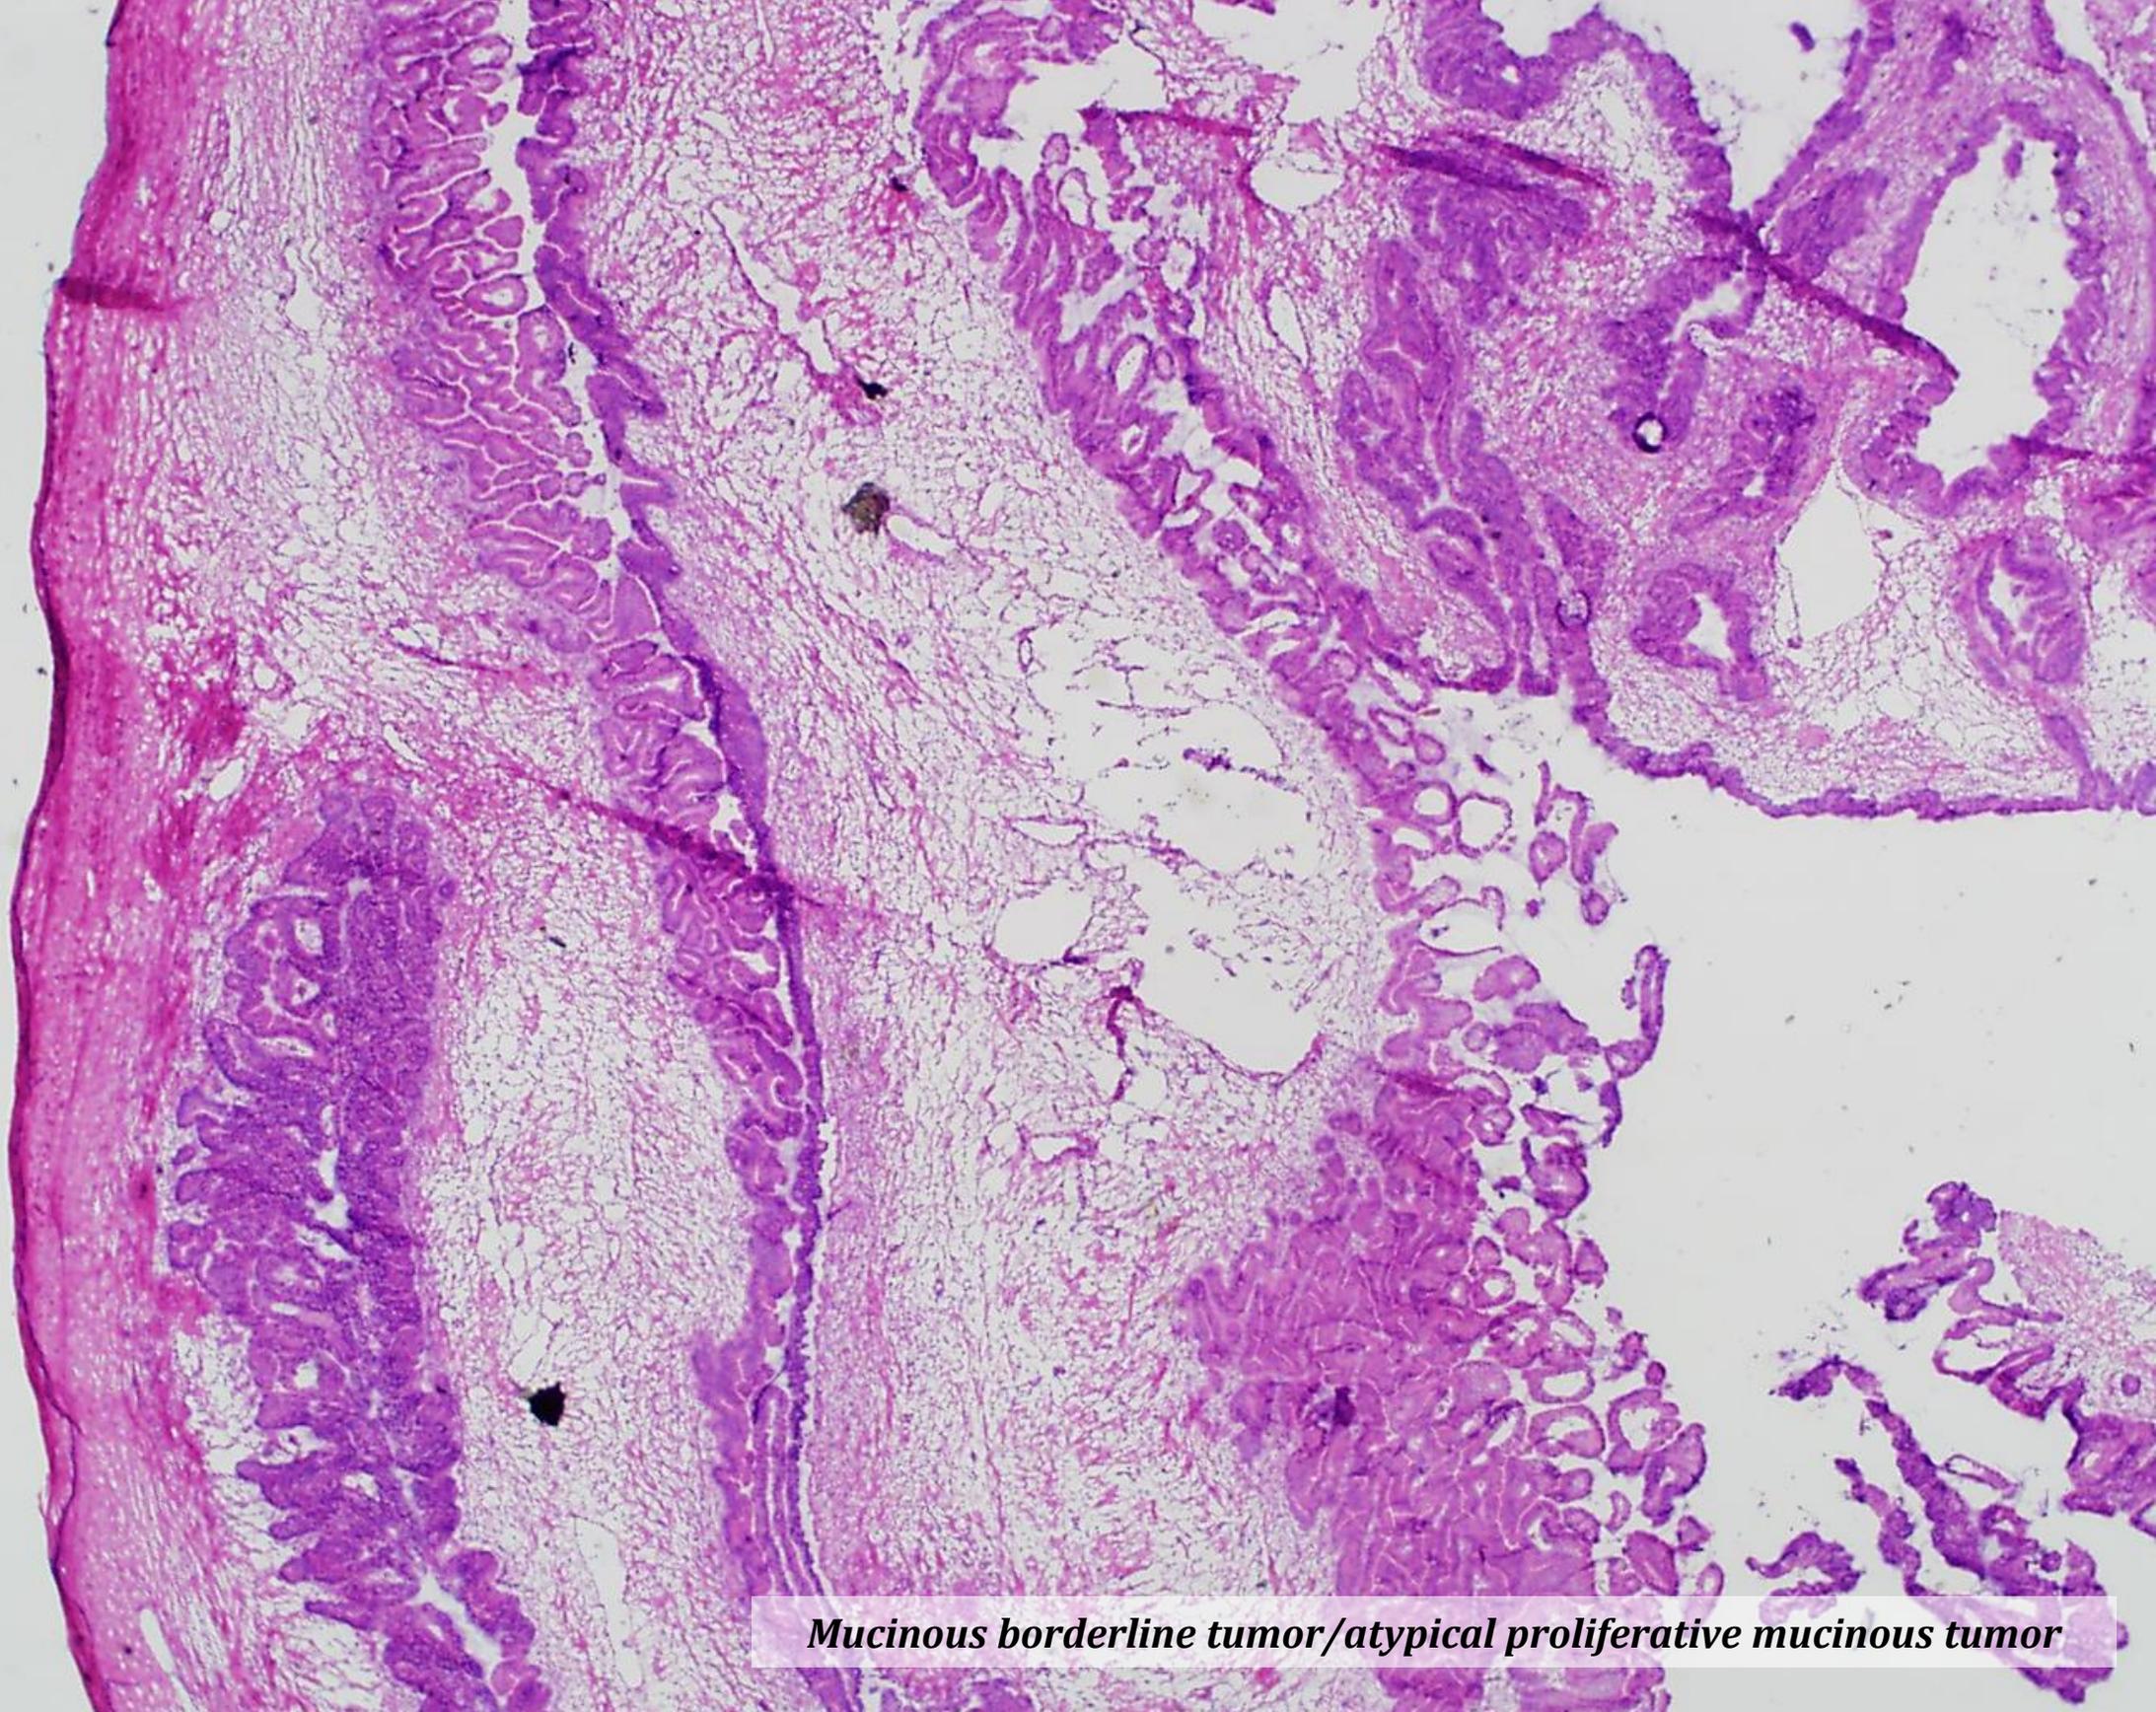

Mucinous cystadenoma

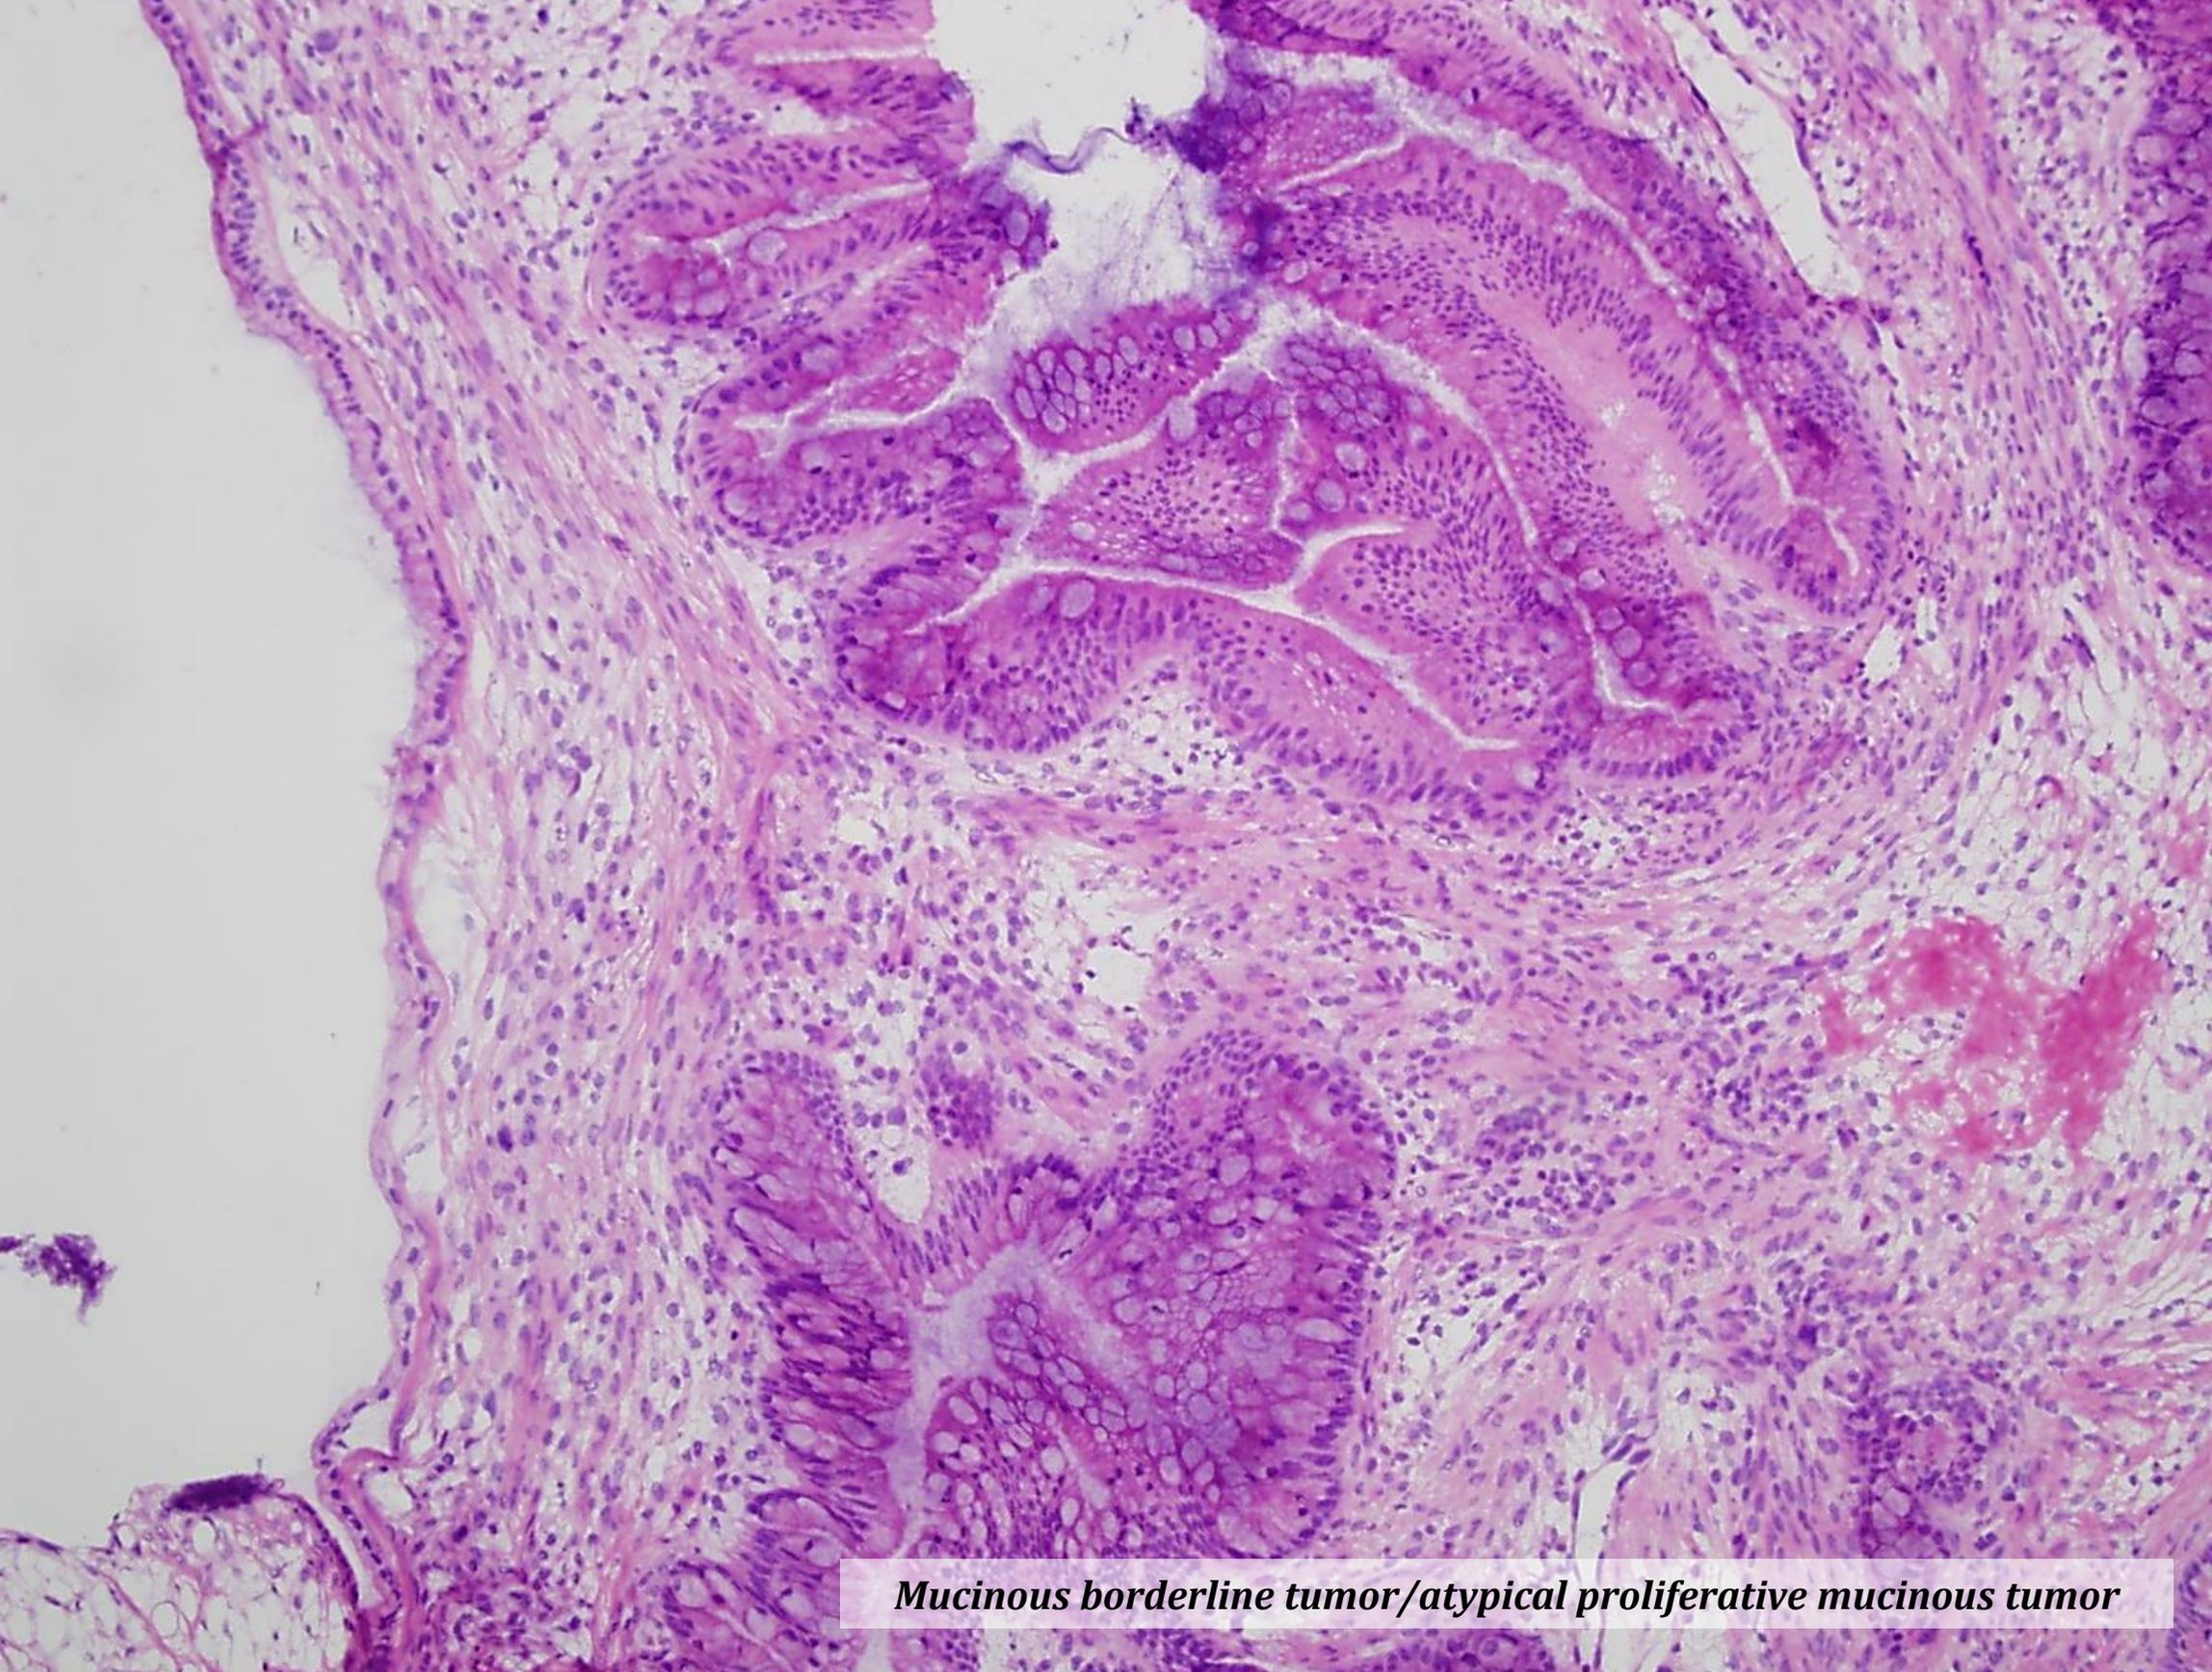

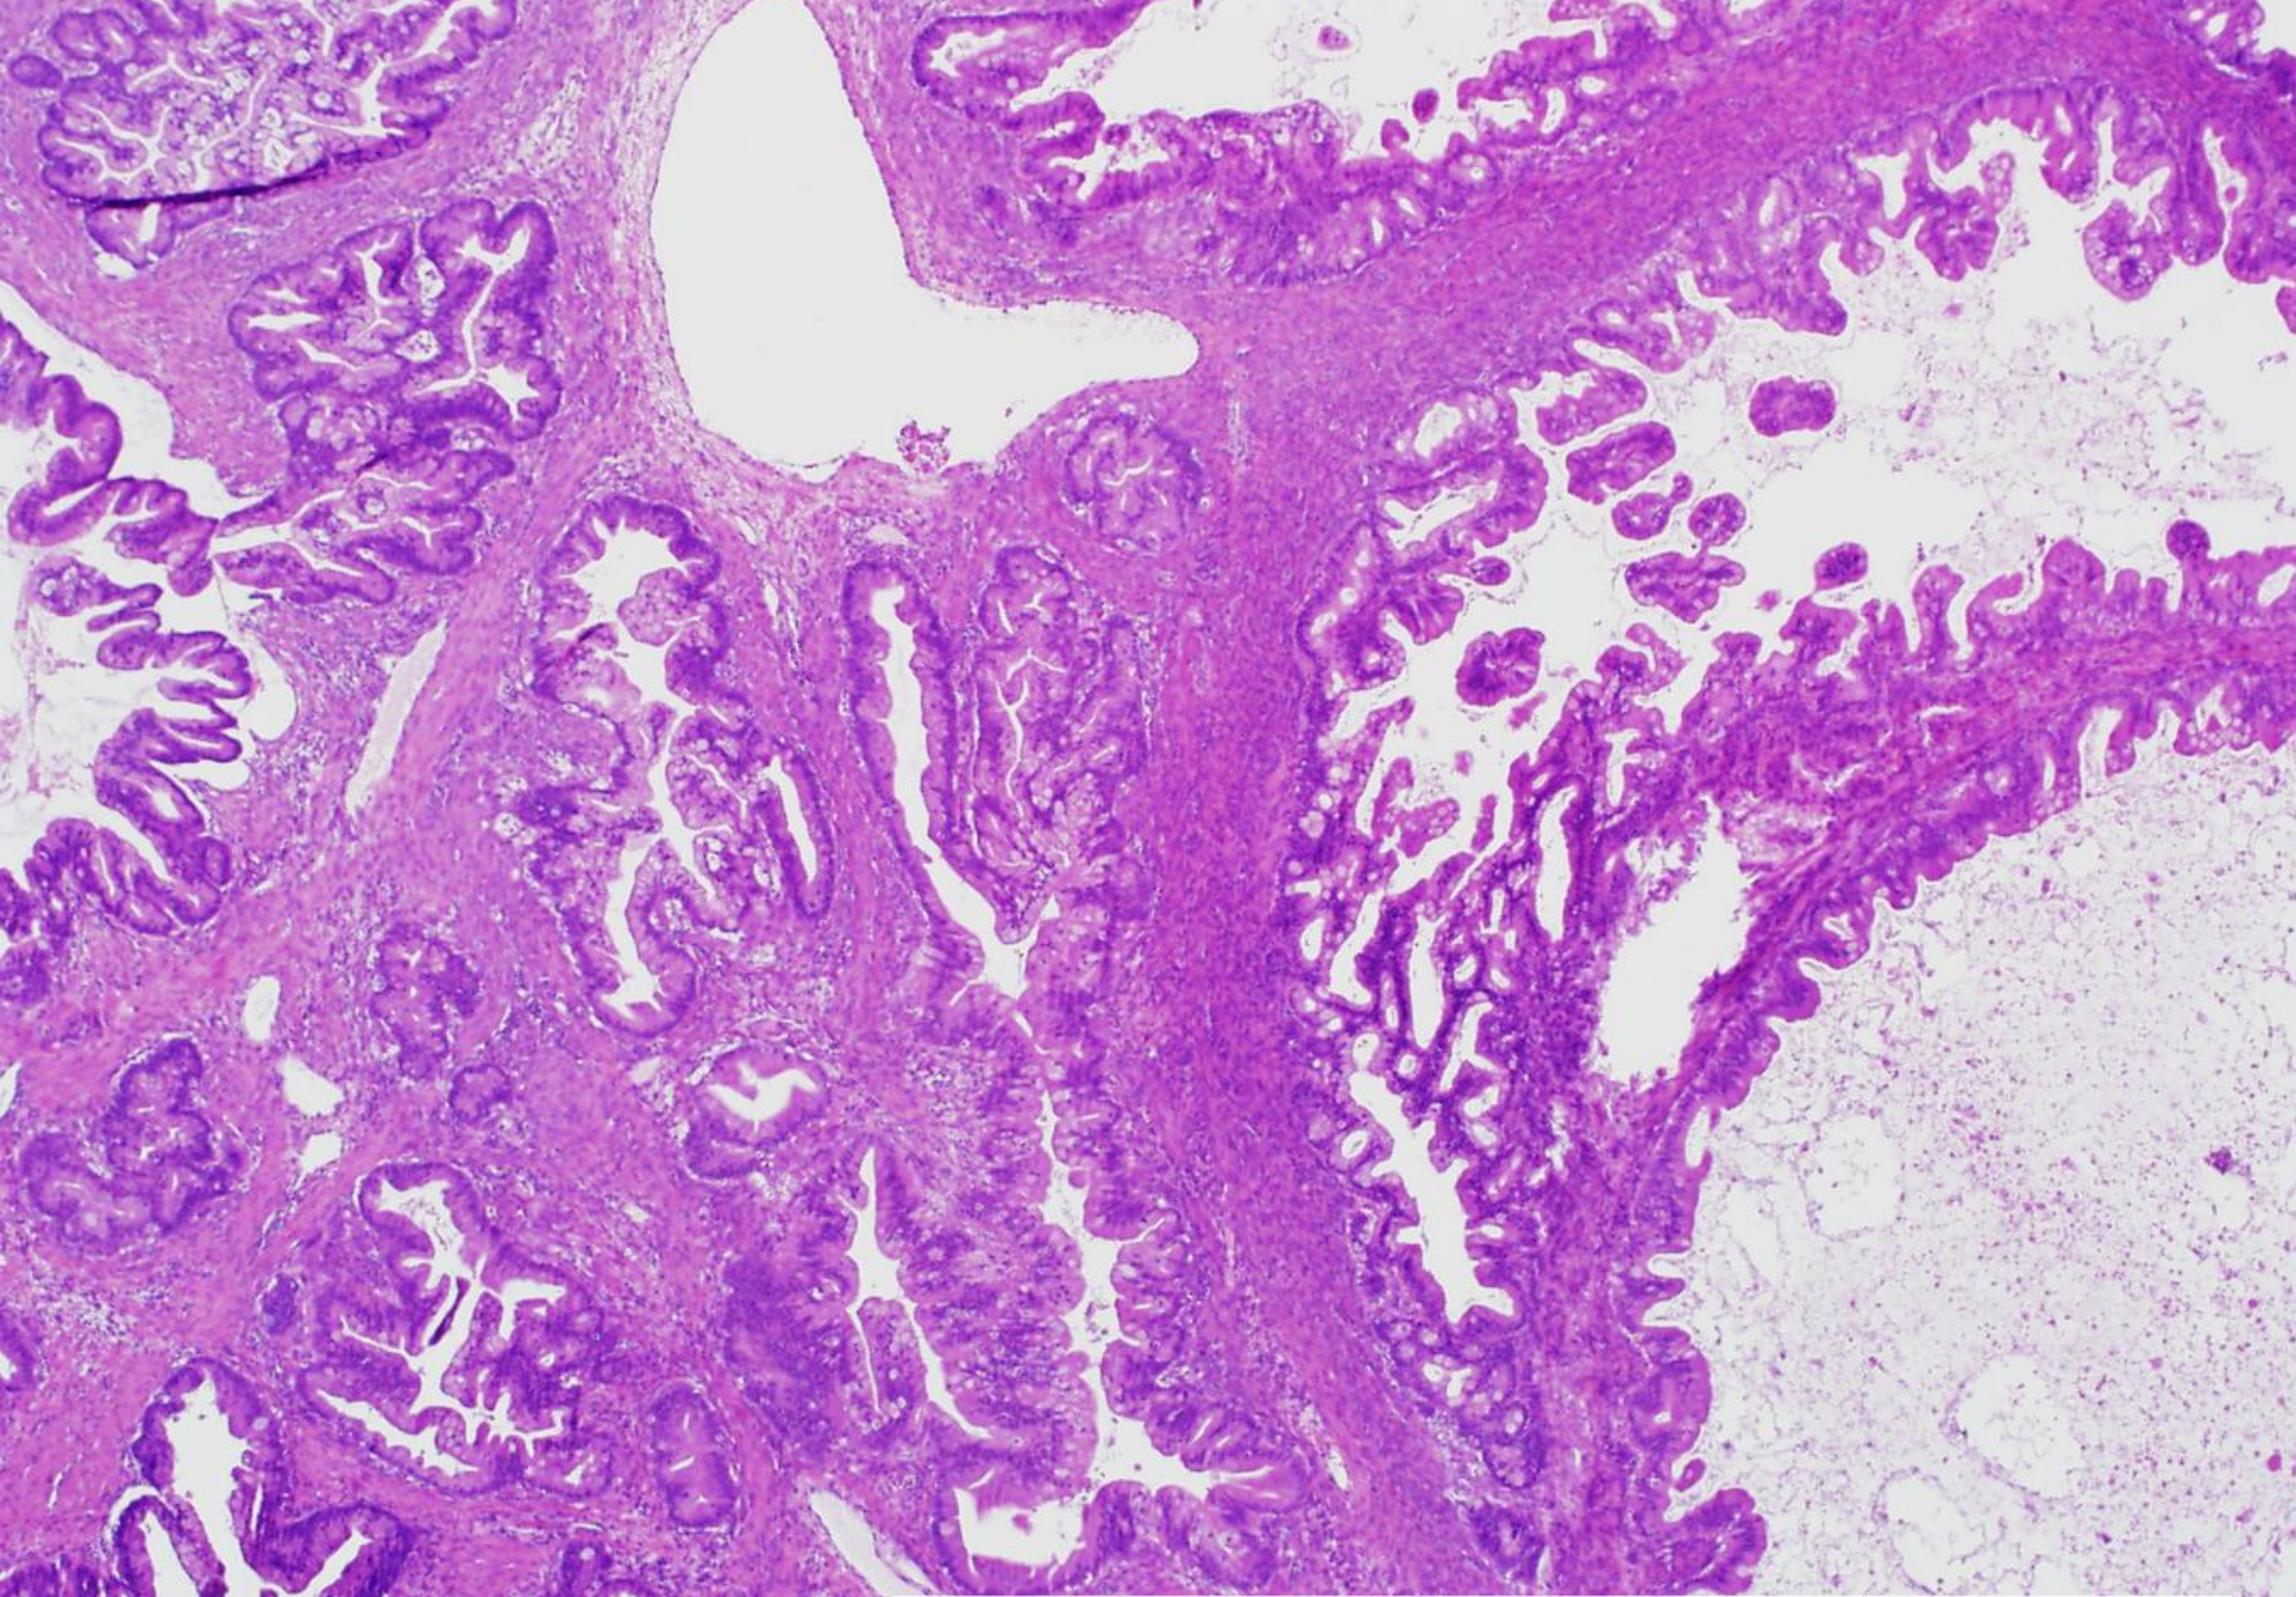

Mucinous borderline tumor/atypical proliferative mucinous tumor

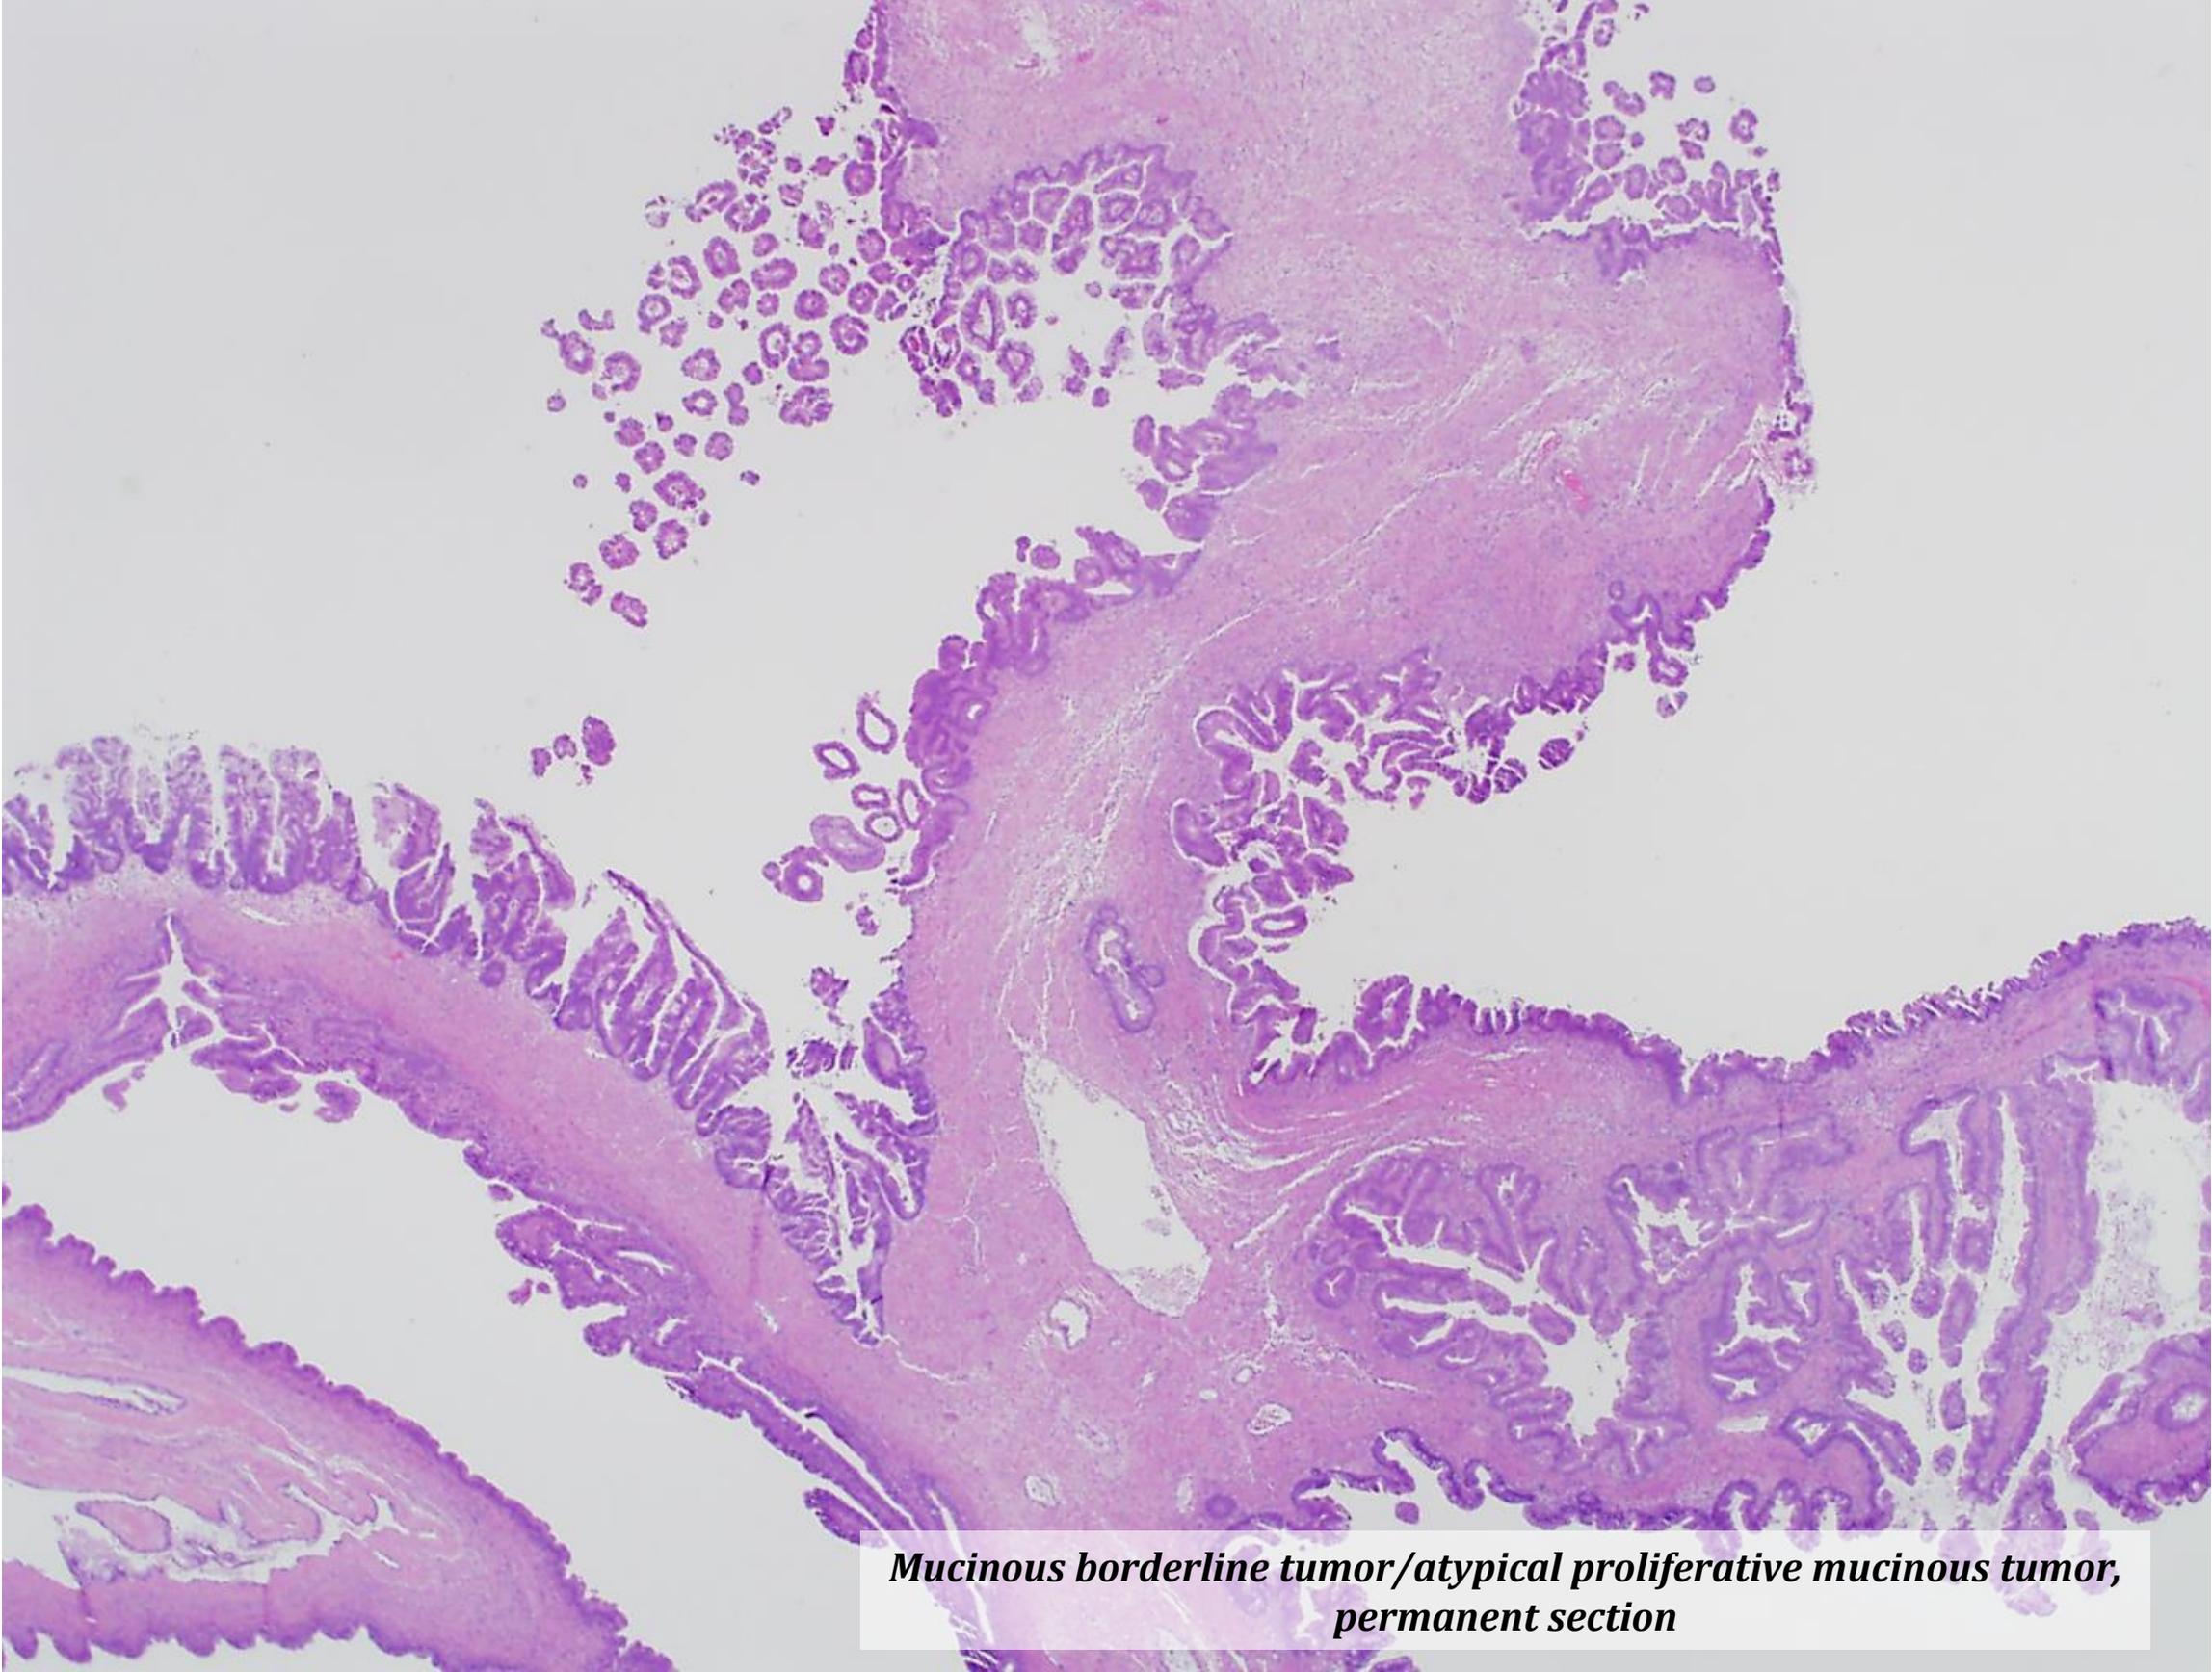

Mucinous borderline tumor/atypical proliferative mucinous tumor

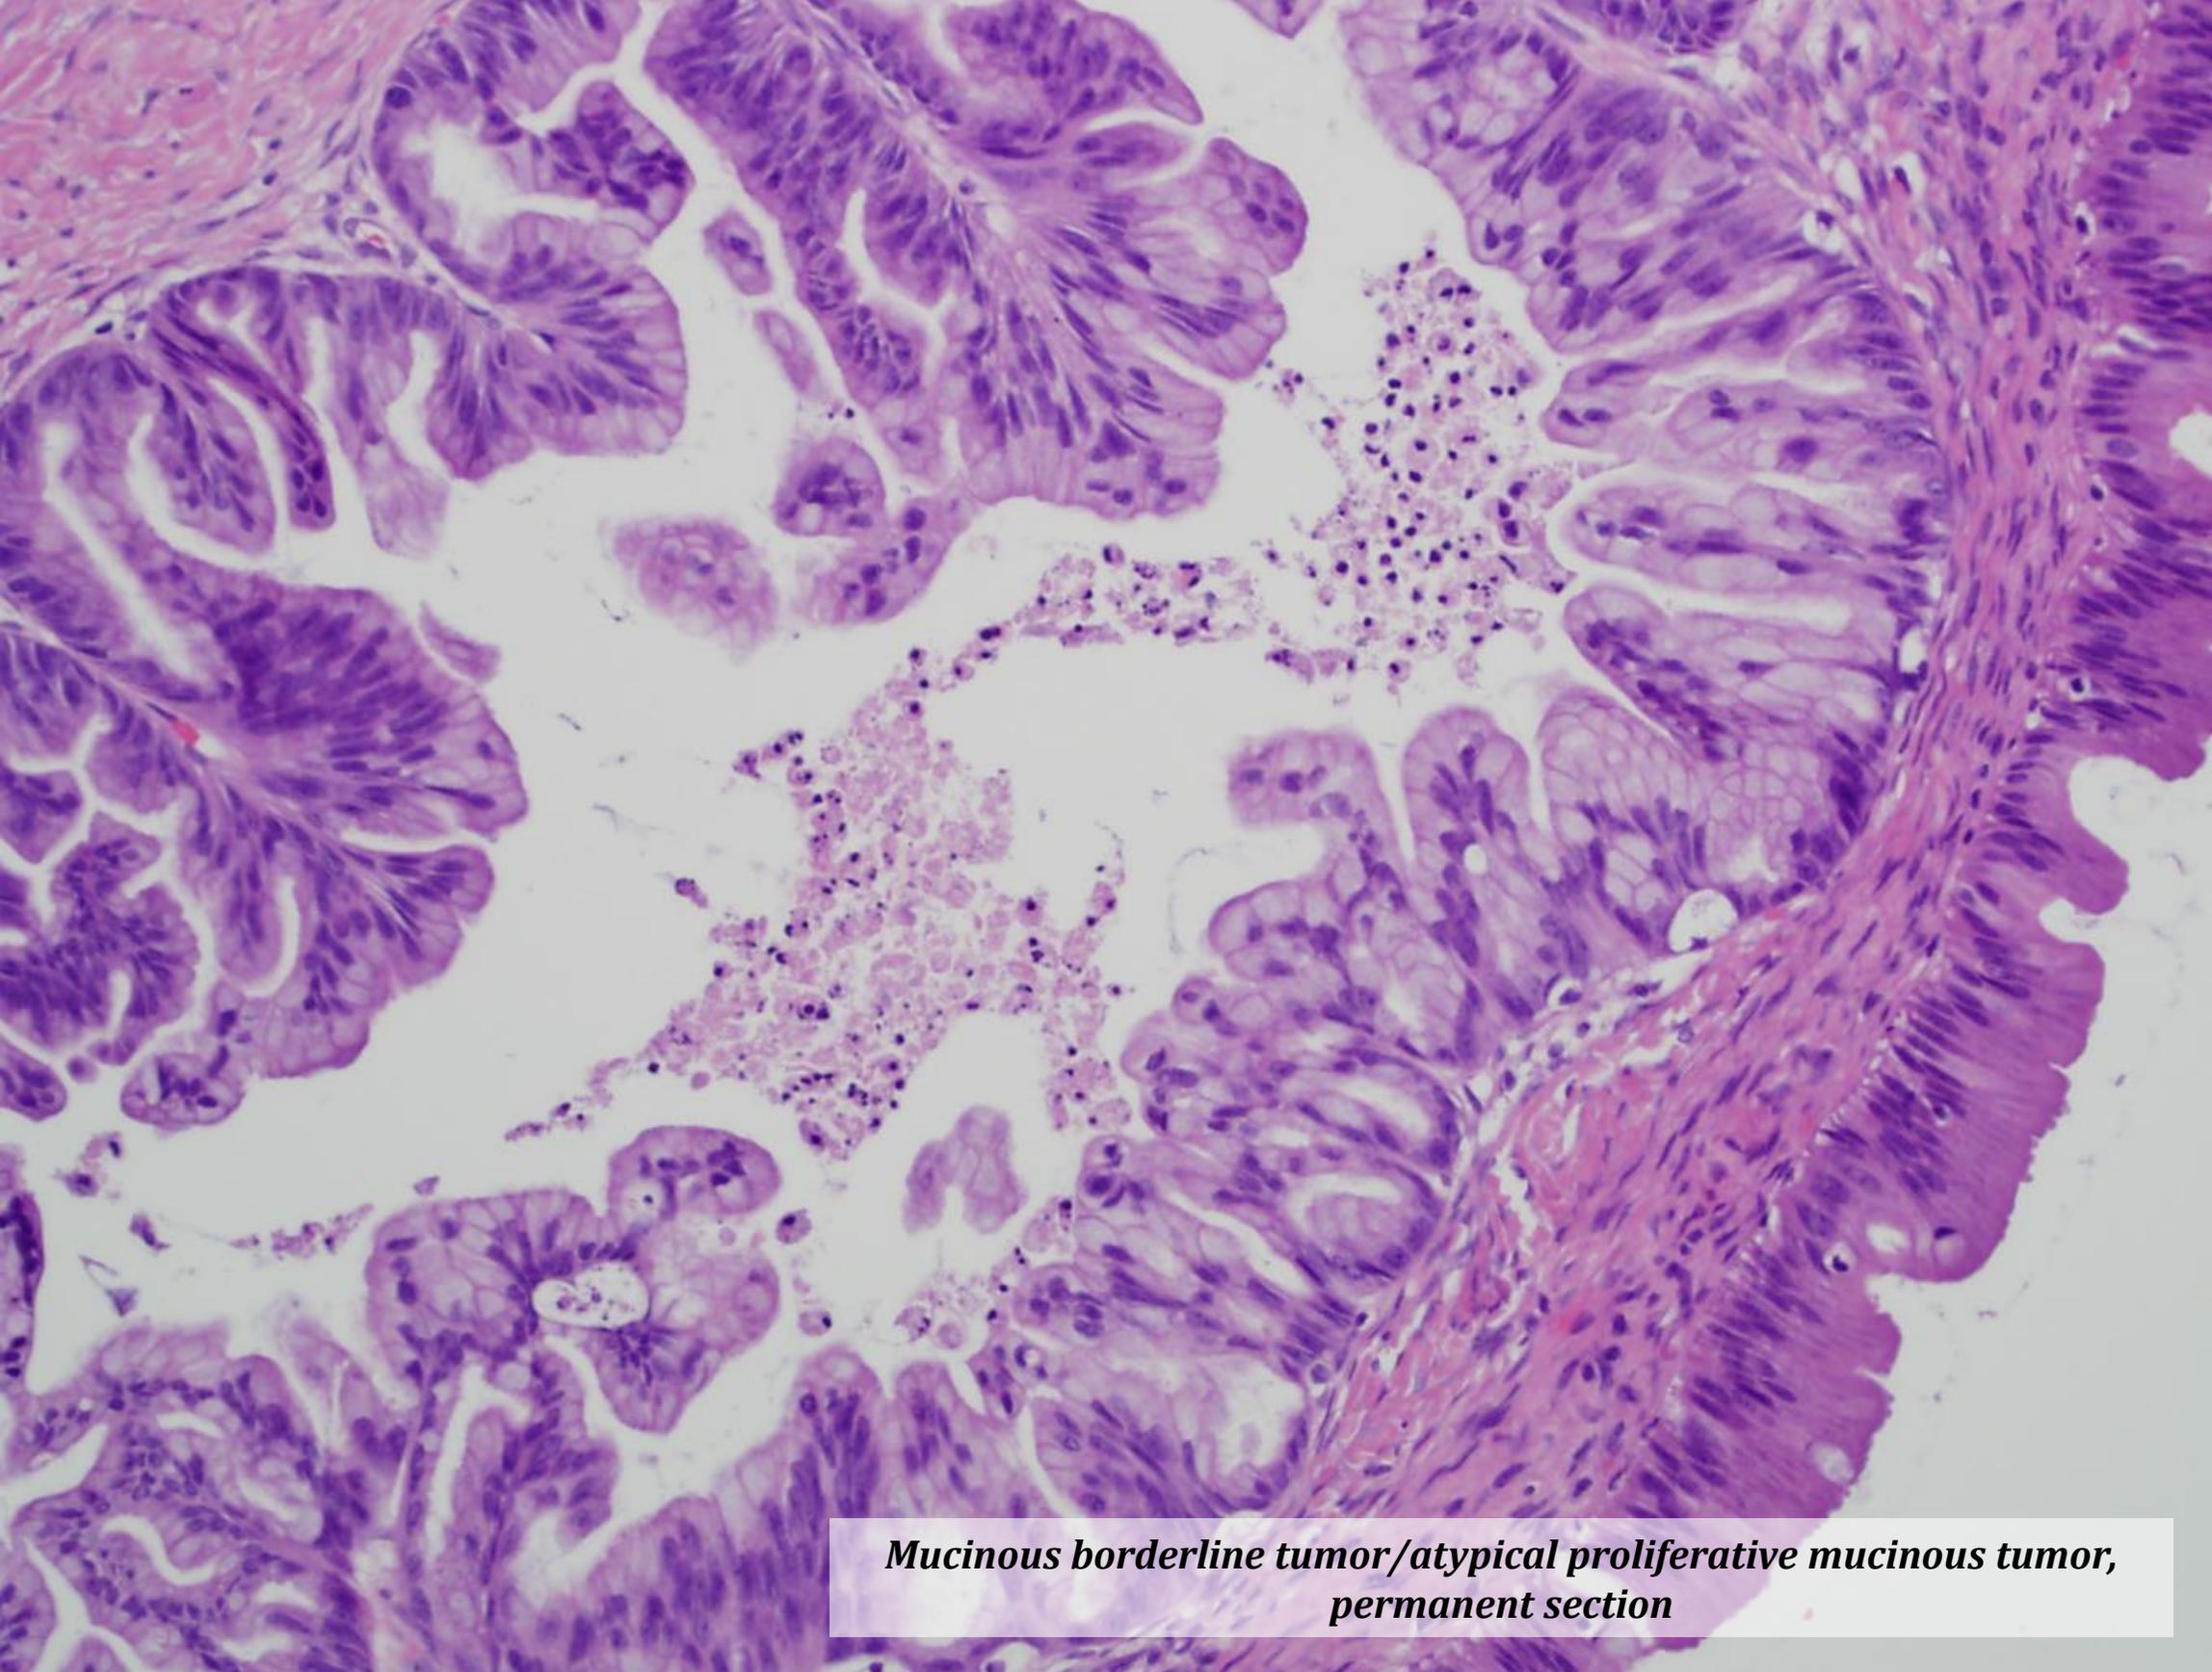

Mucinous borderline tumor/atypical proliferative mucinous tumor

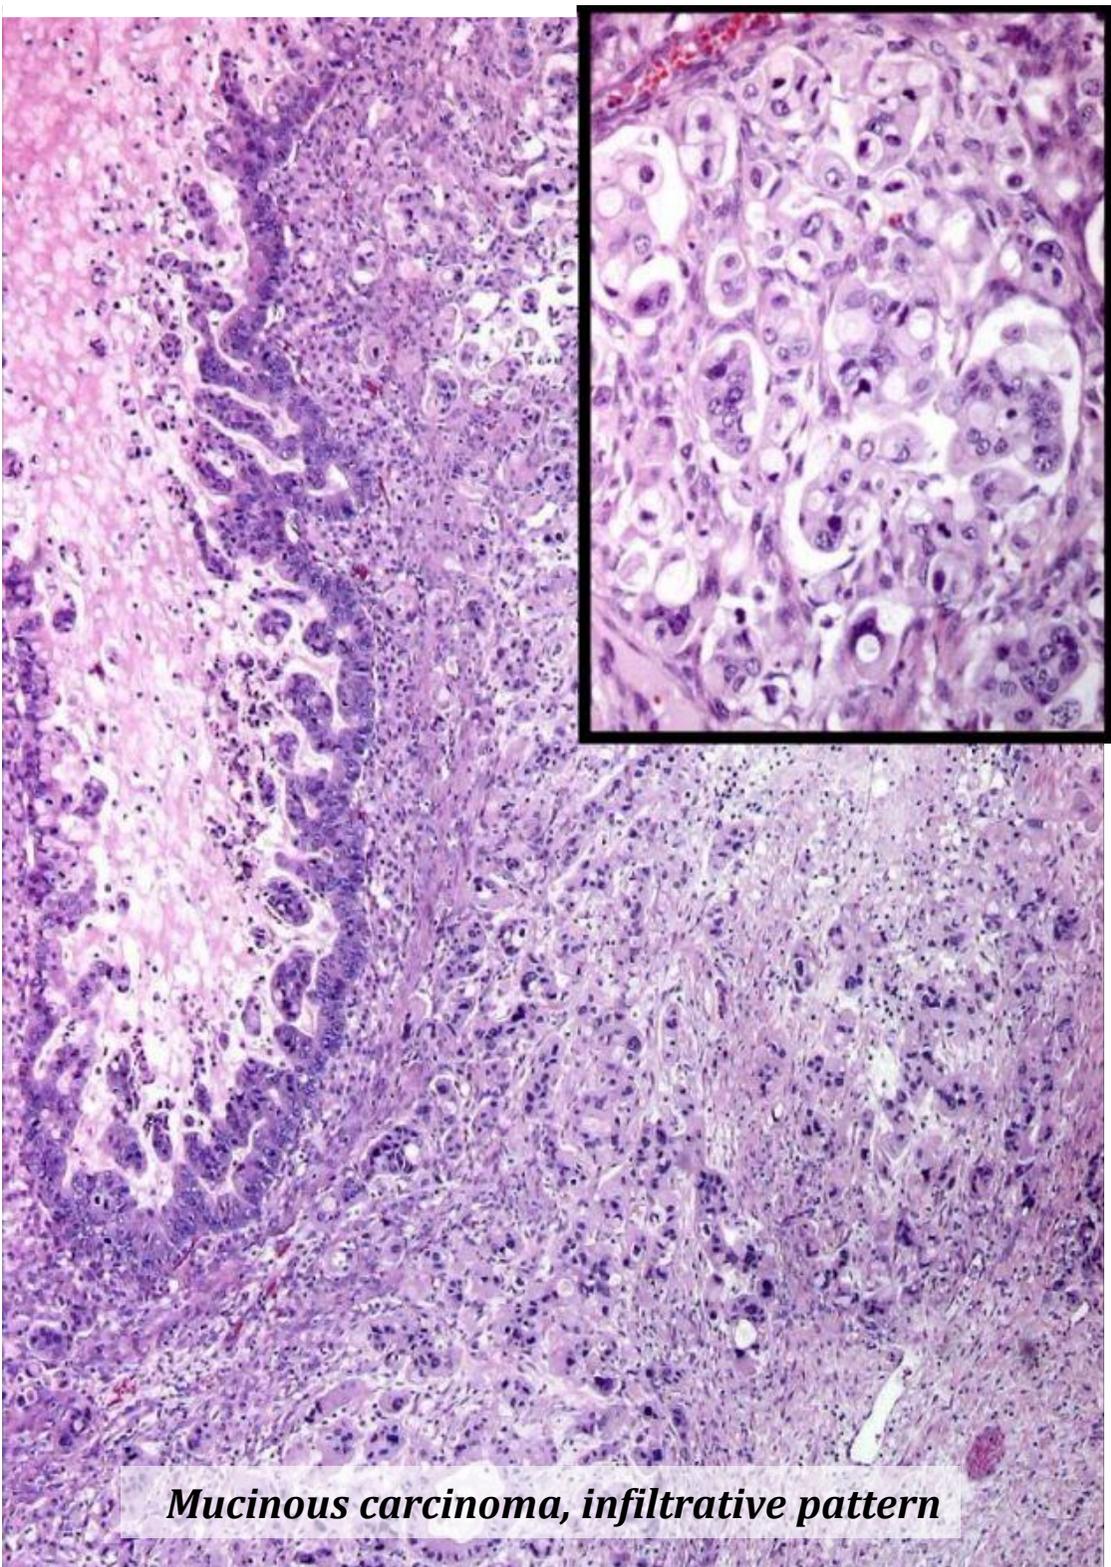

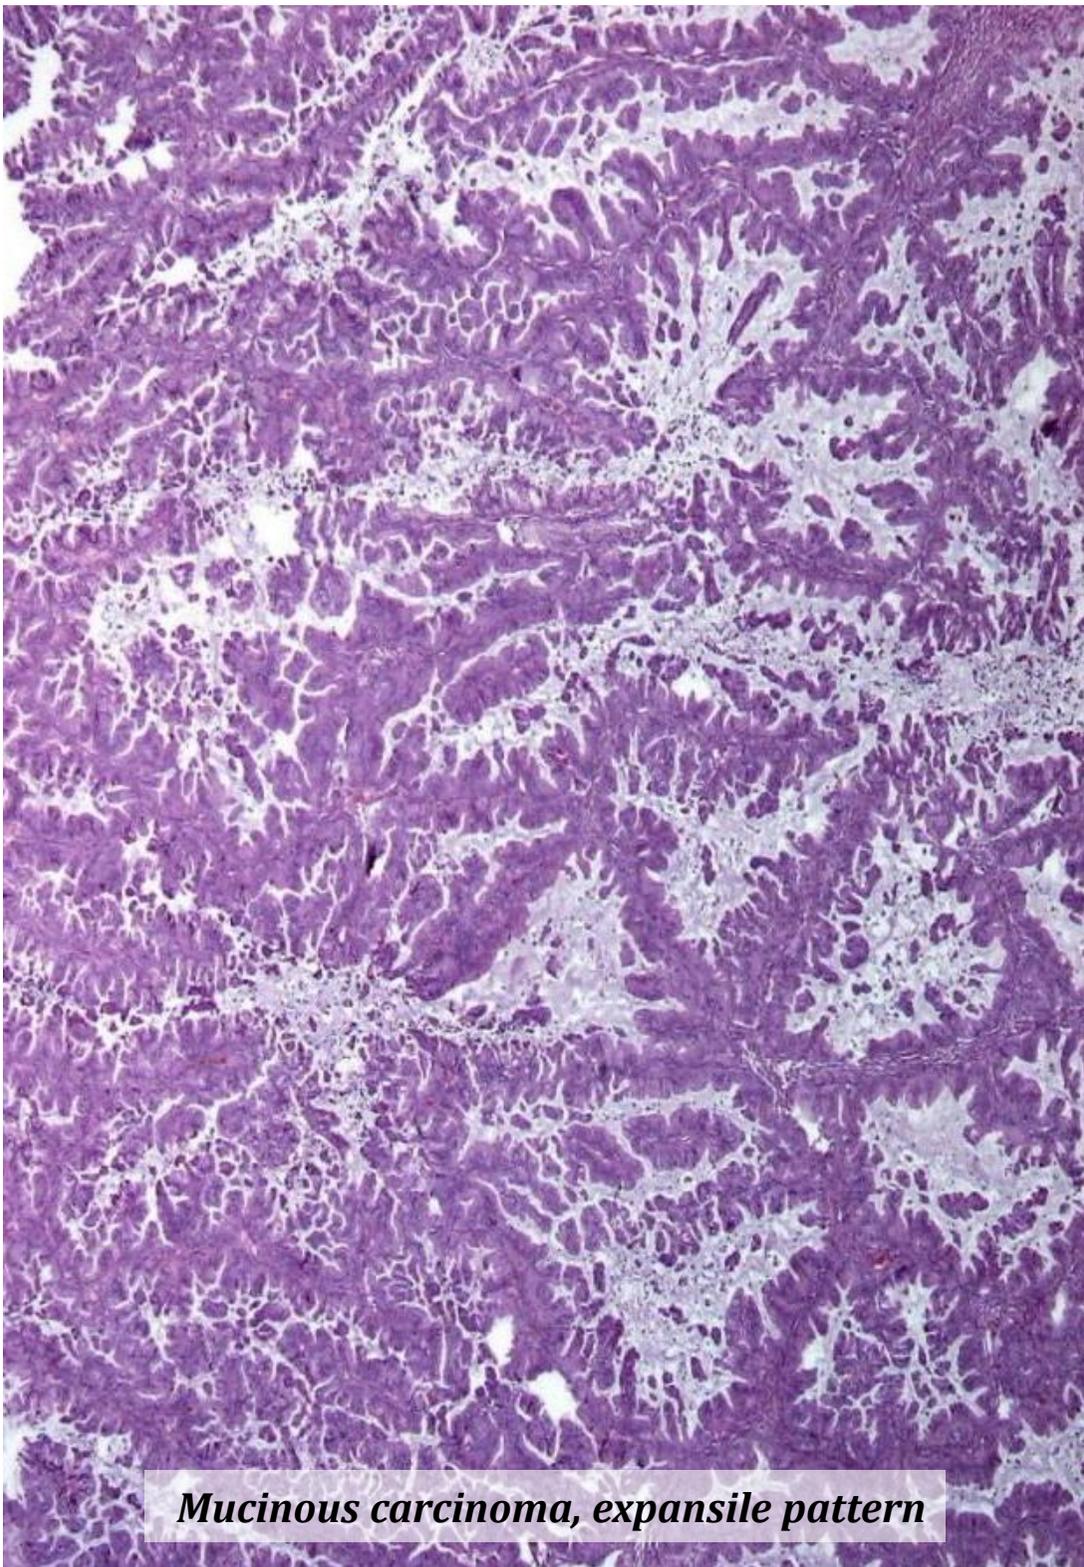

*Mucinous borderline tumor/atypical proliferative mucinous tumor,
permanent section*

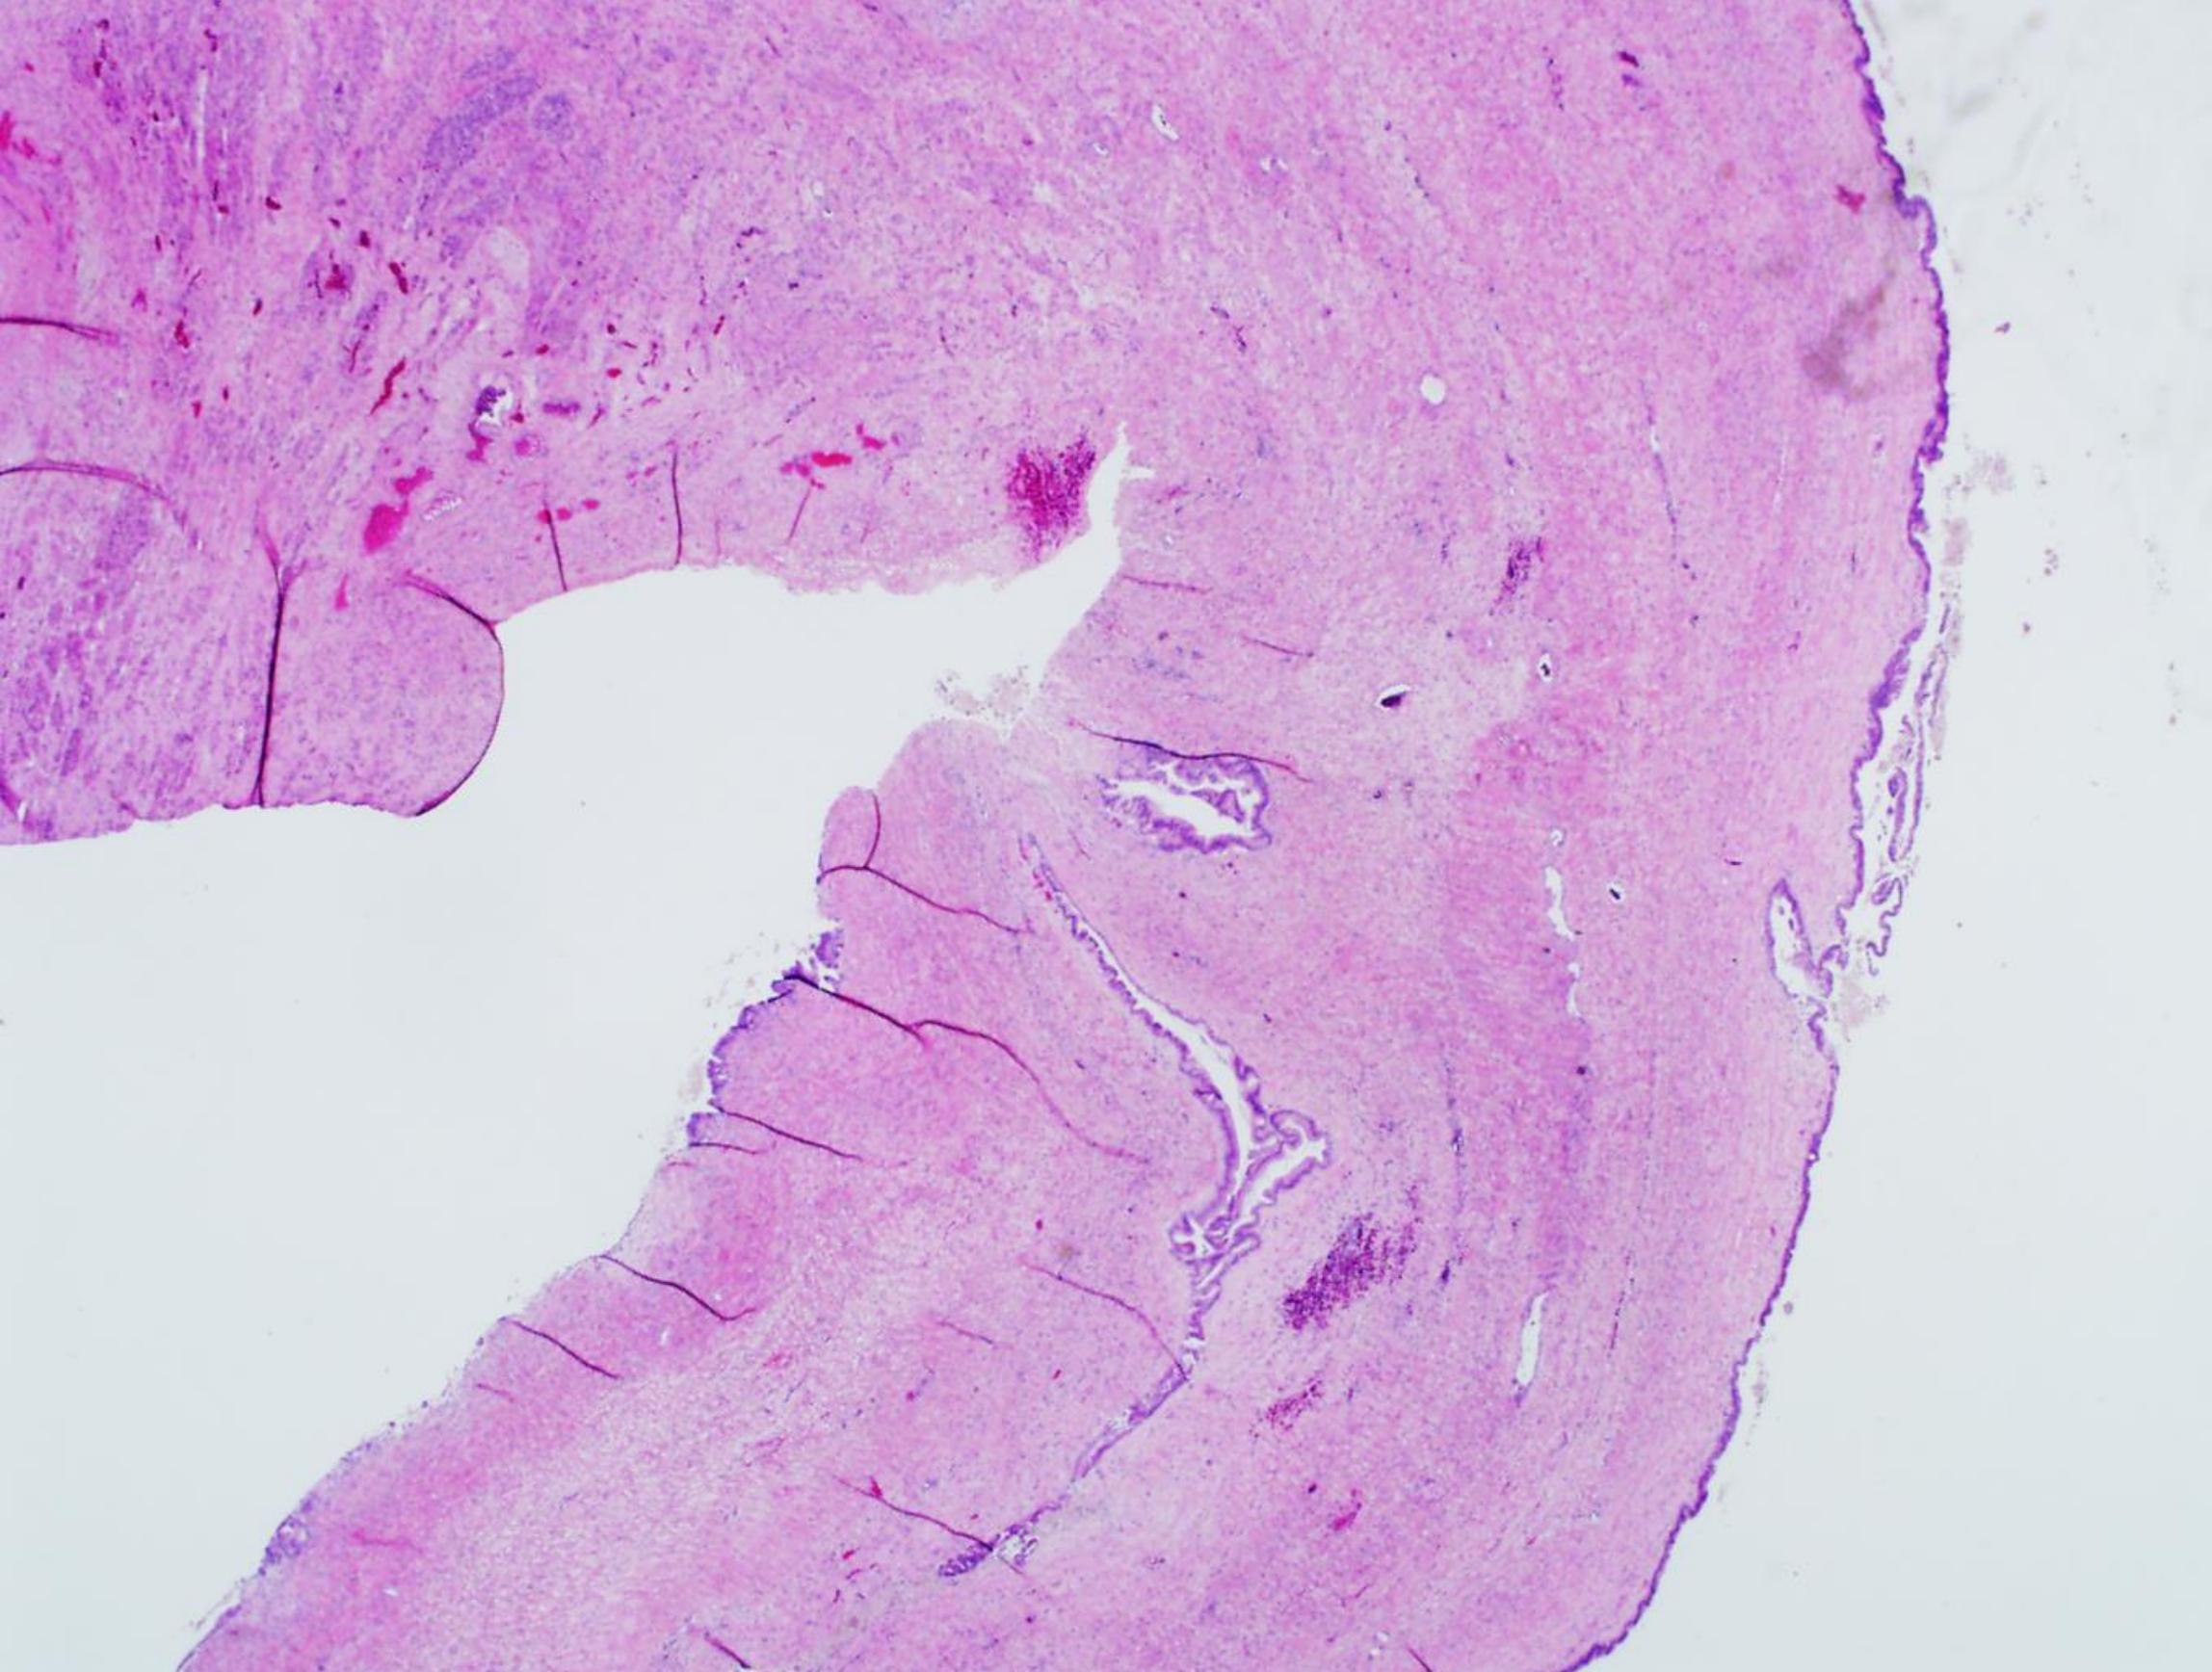

*Mucinous borderline tumor/atypical proliferative mucinous tumor,
permanent section*

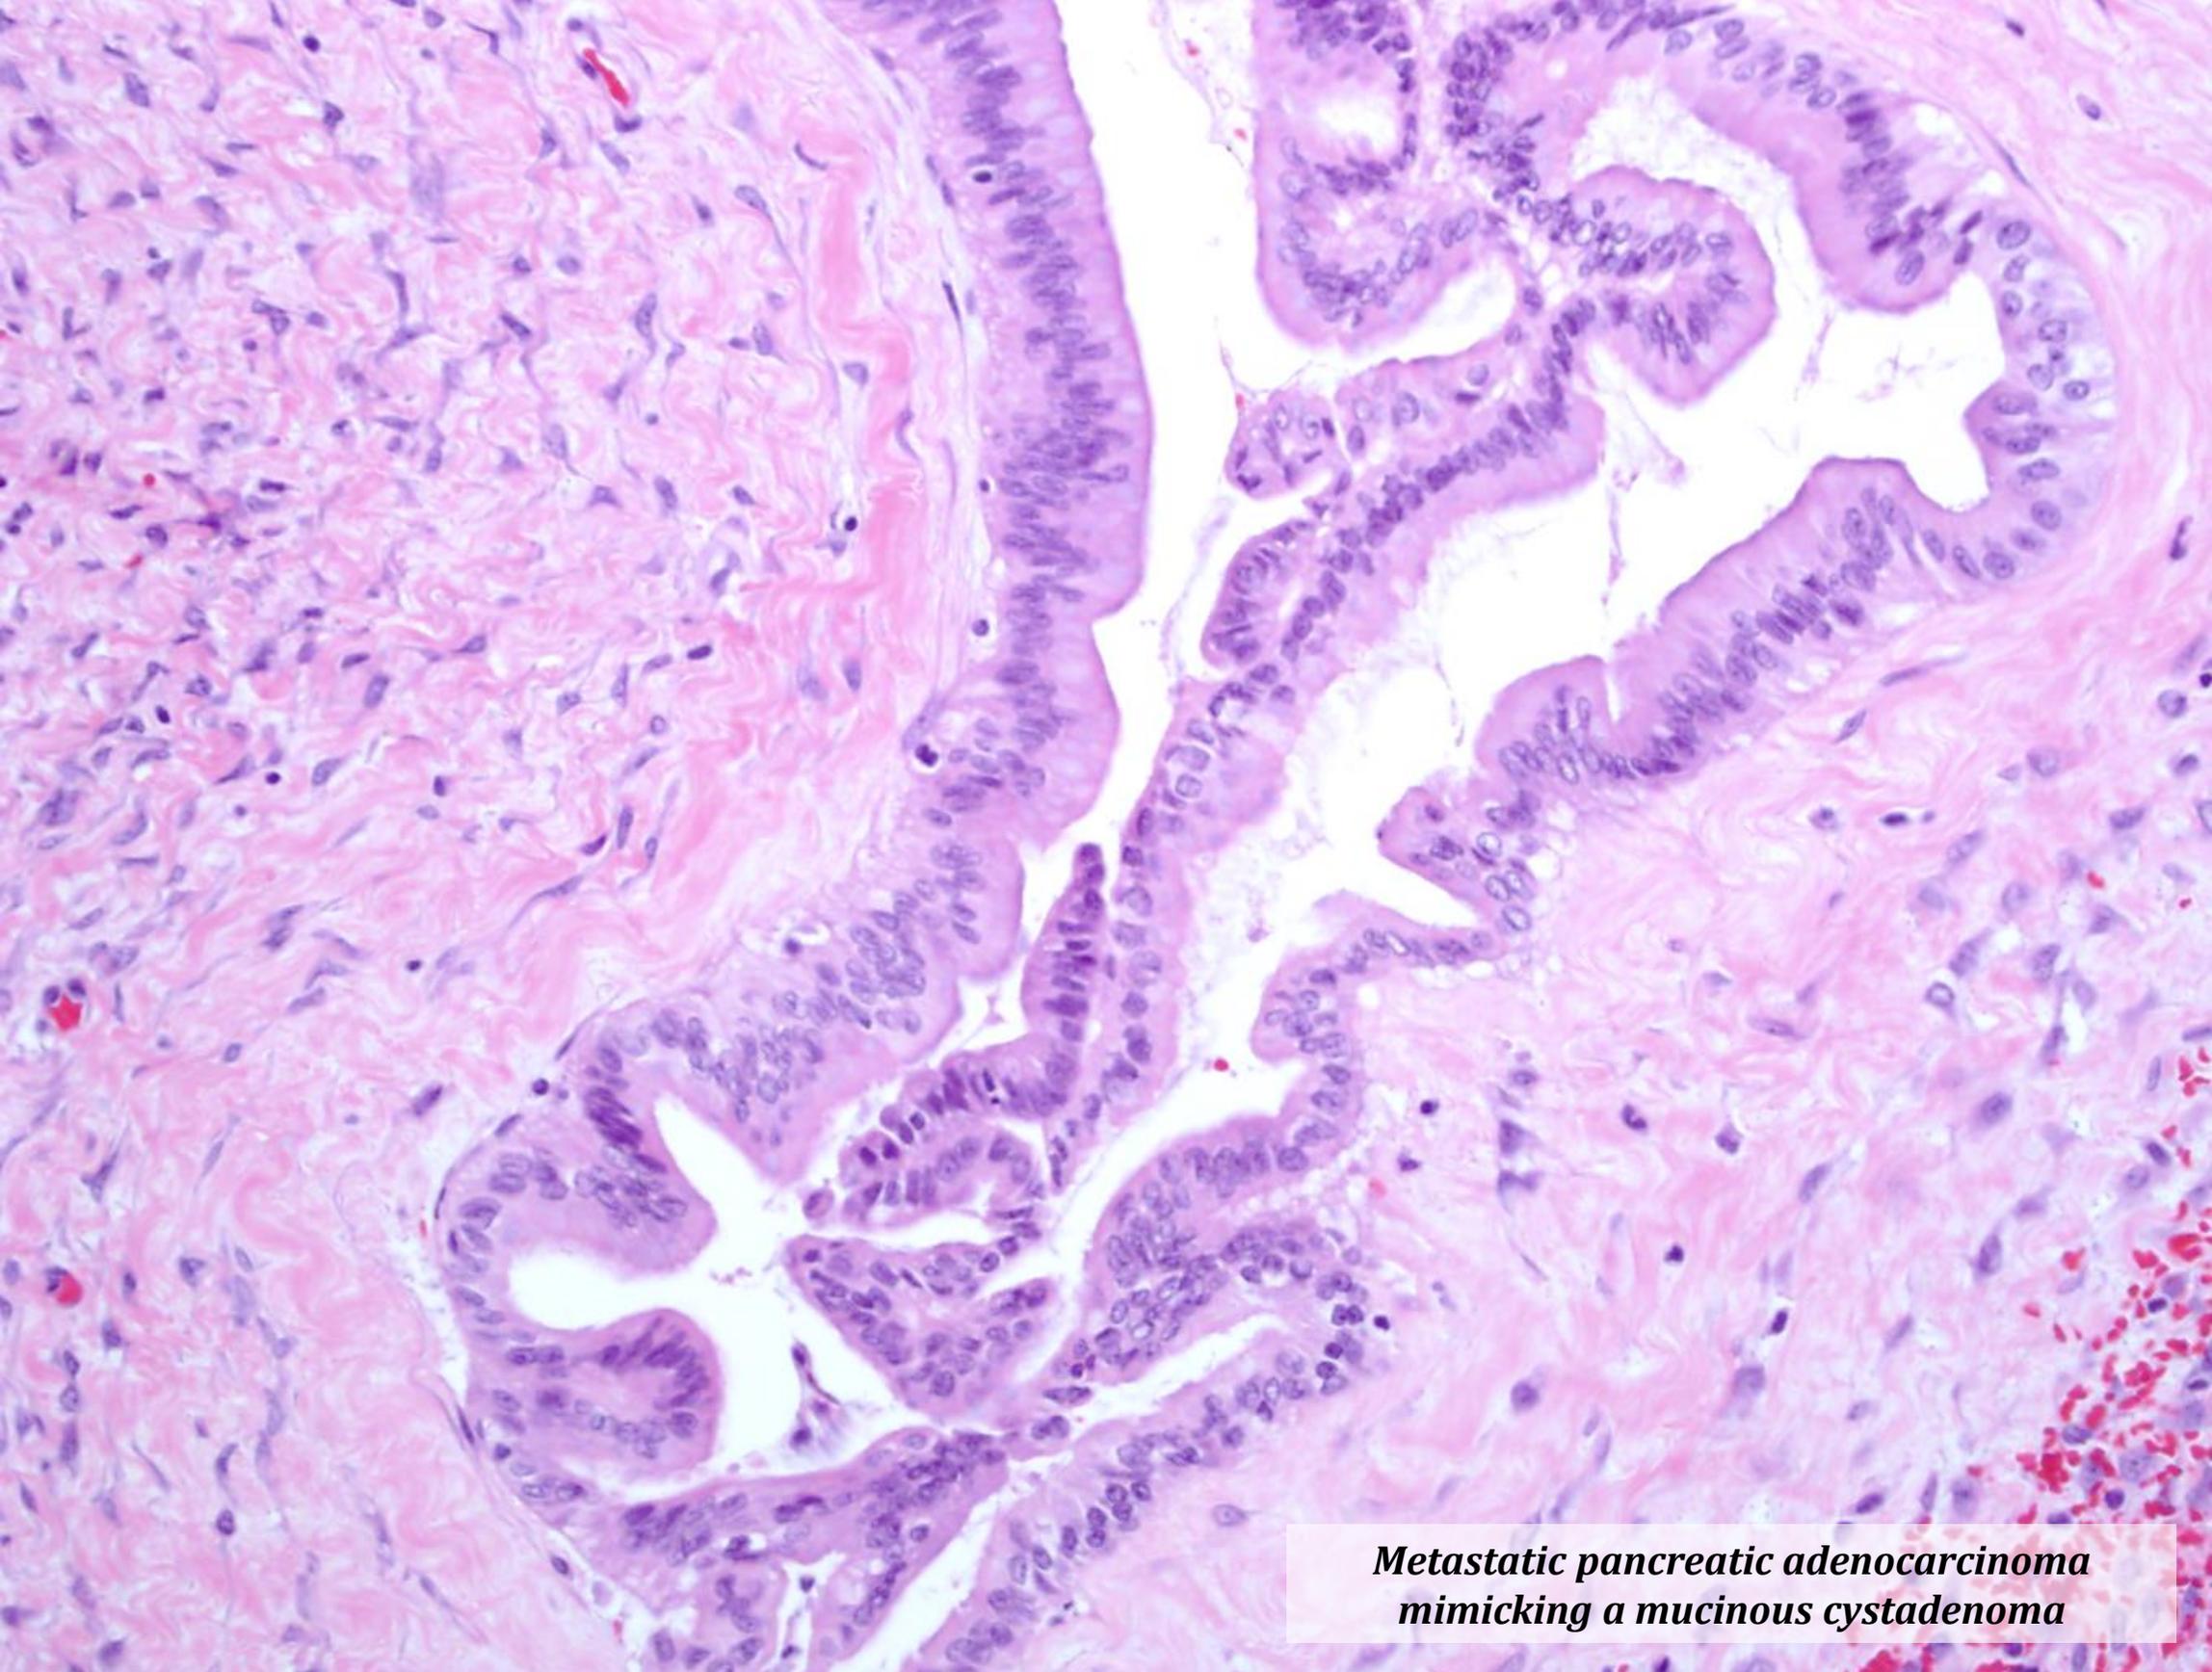

*Mucinous borderline tumor/atypical proliferative mucinous tumor,
permanent section*

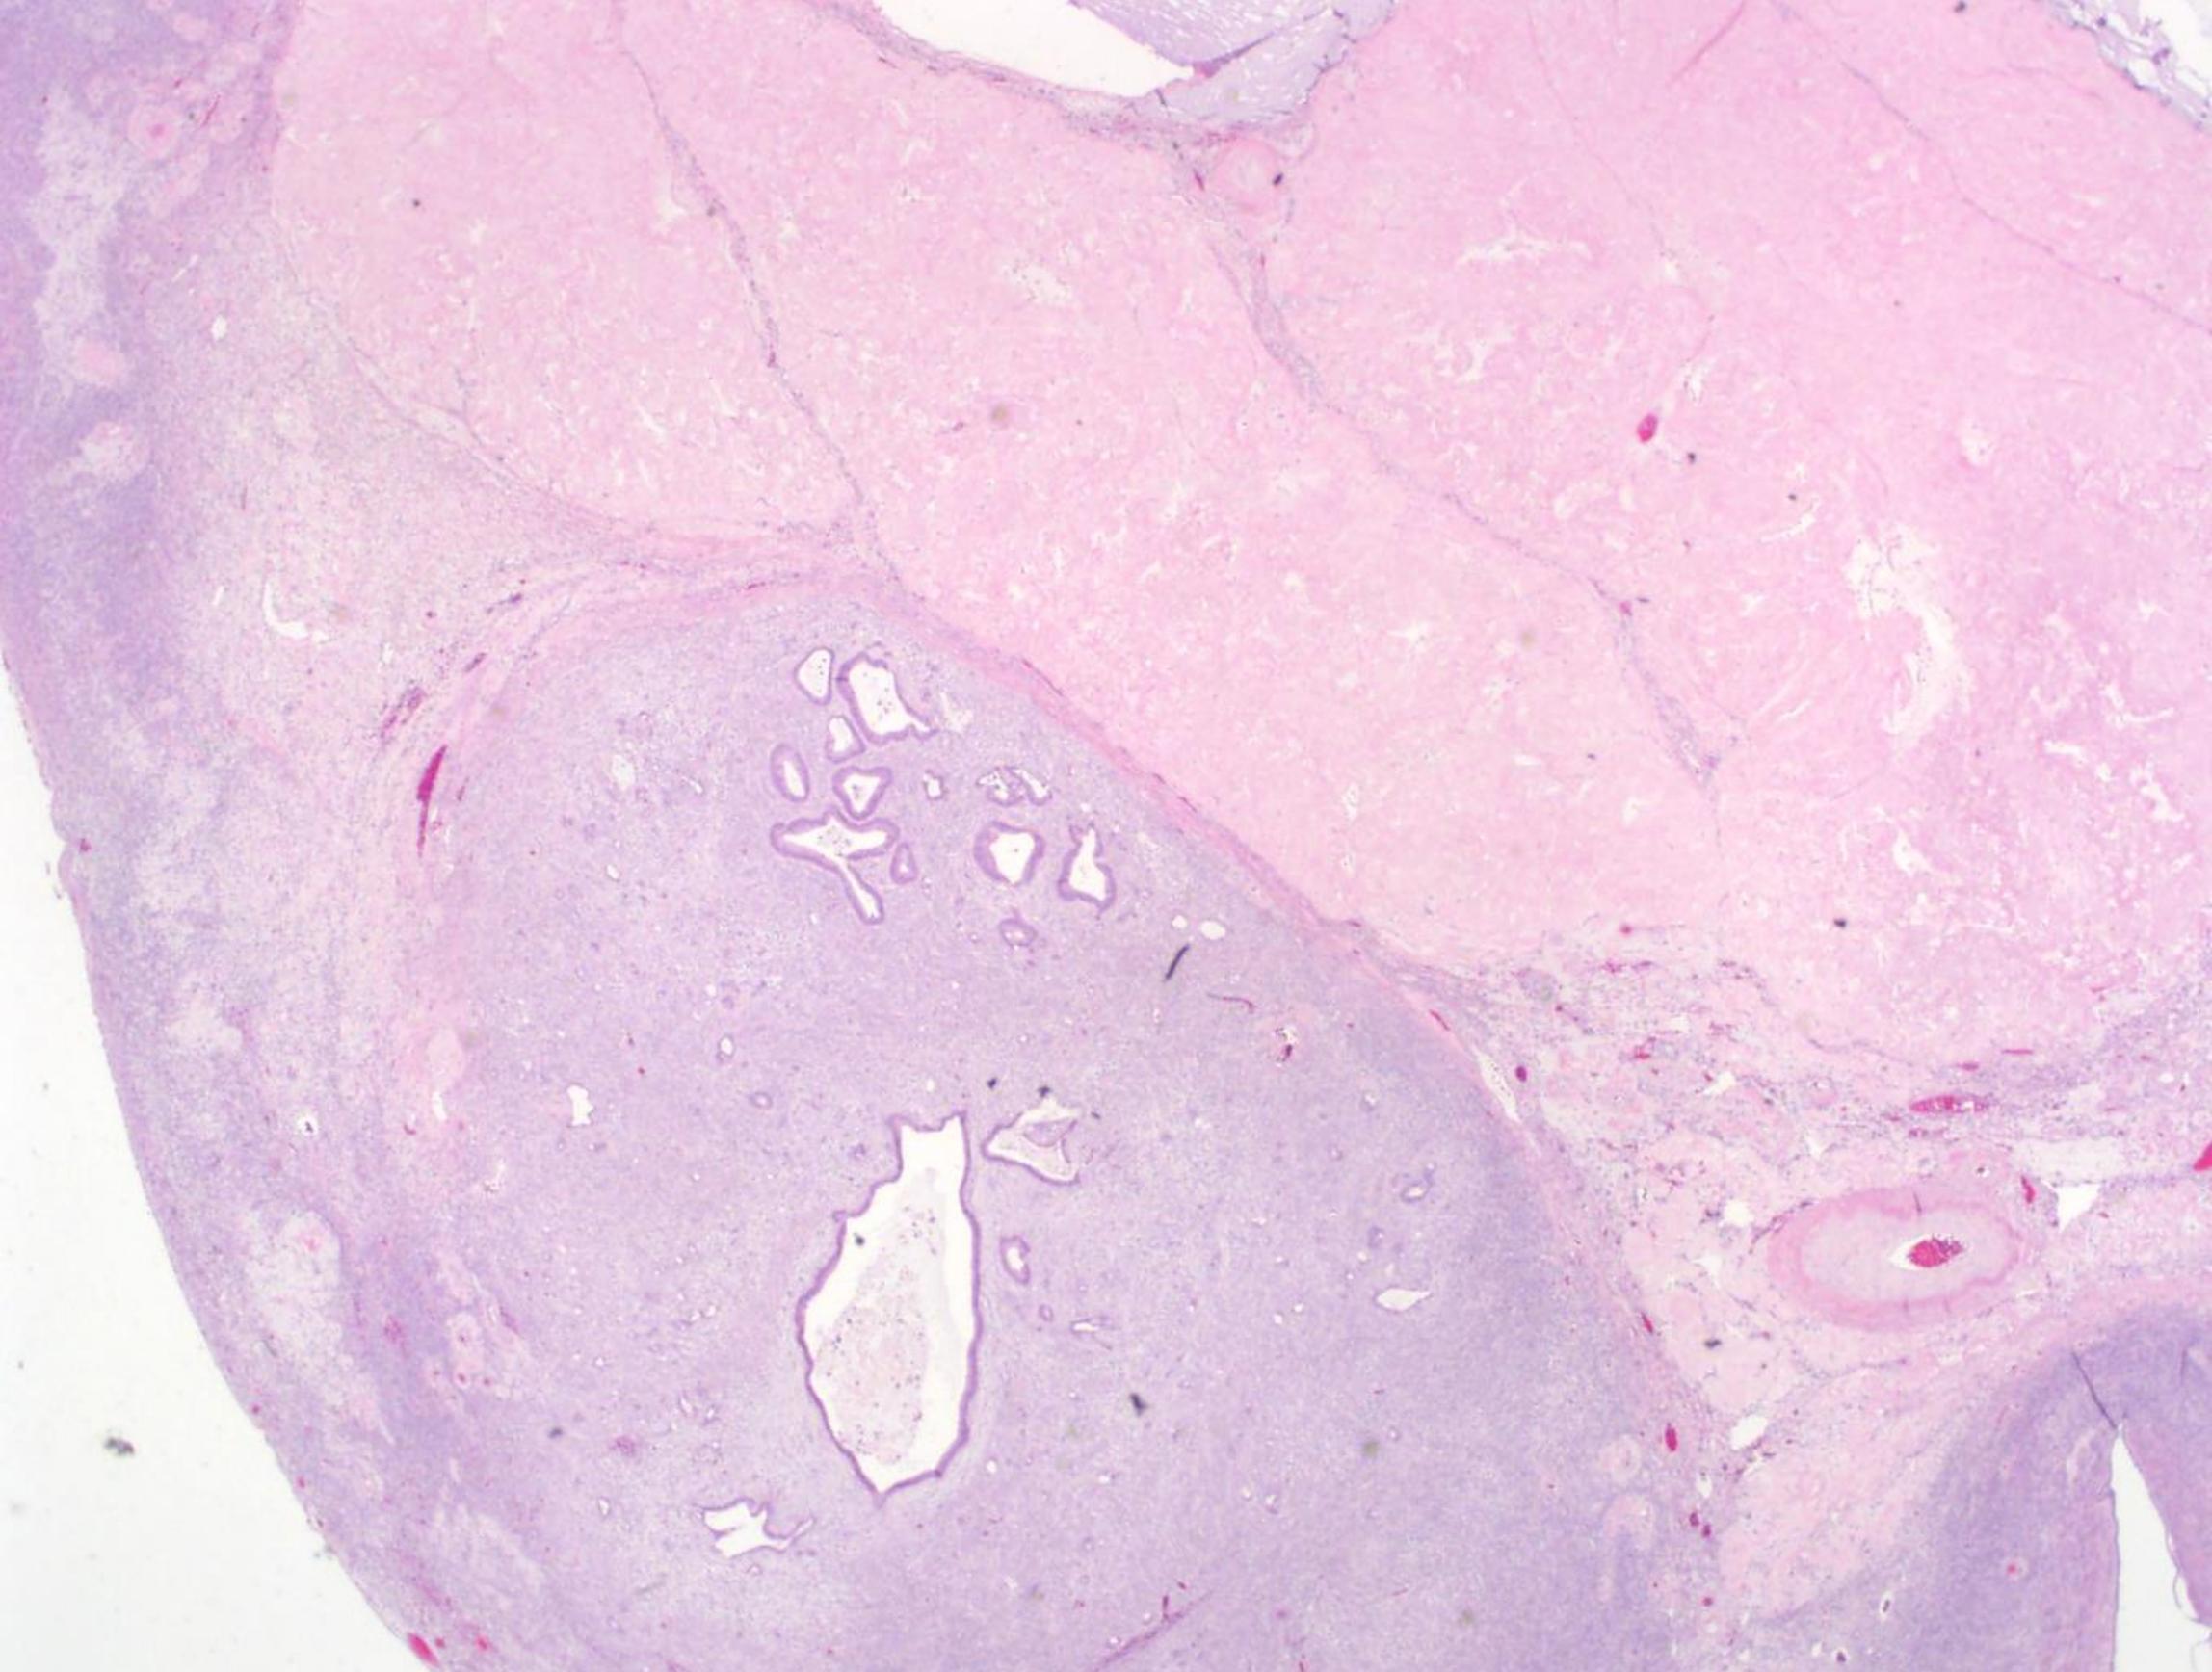

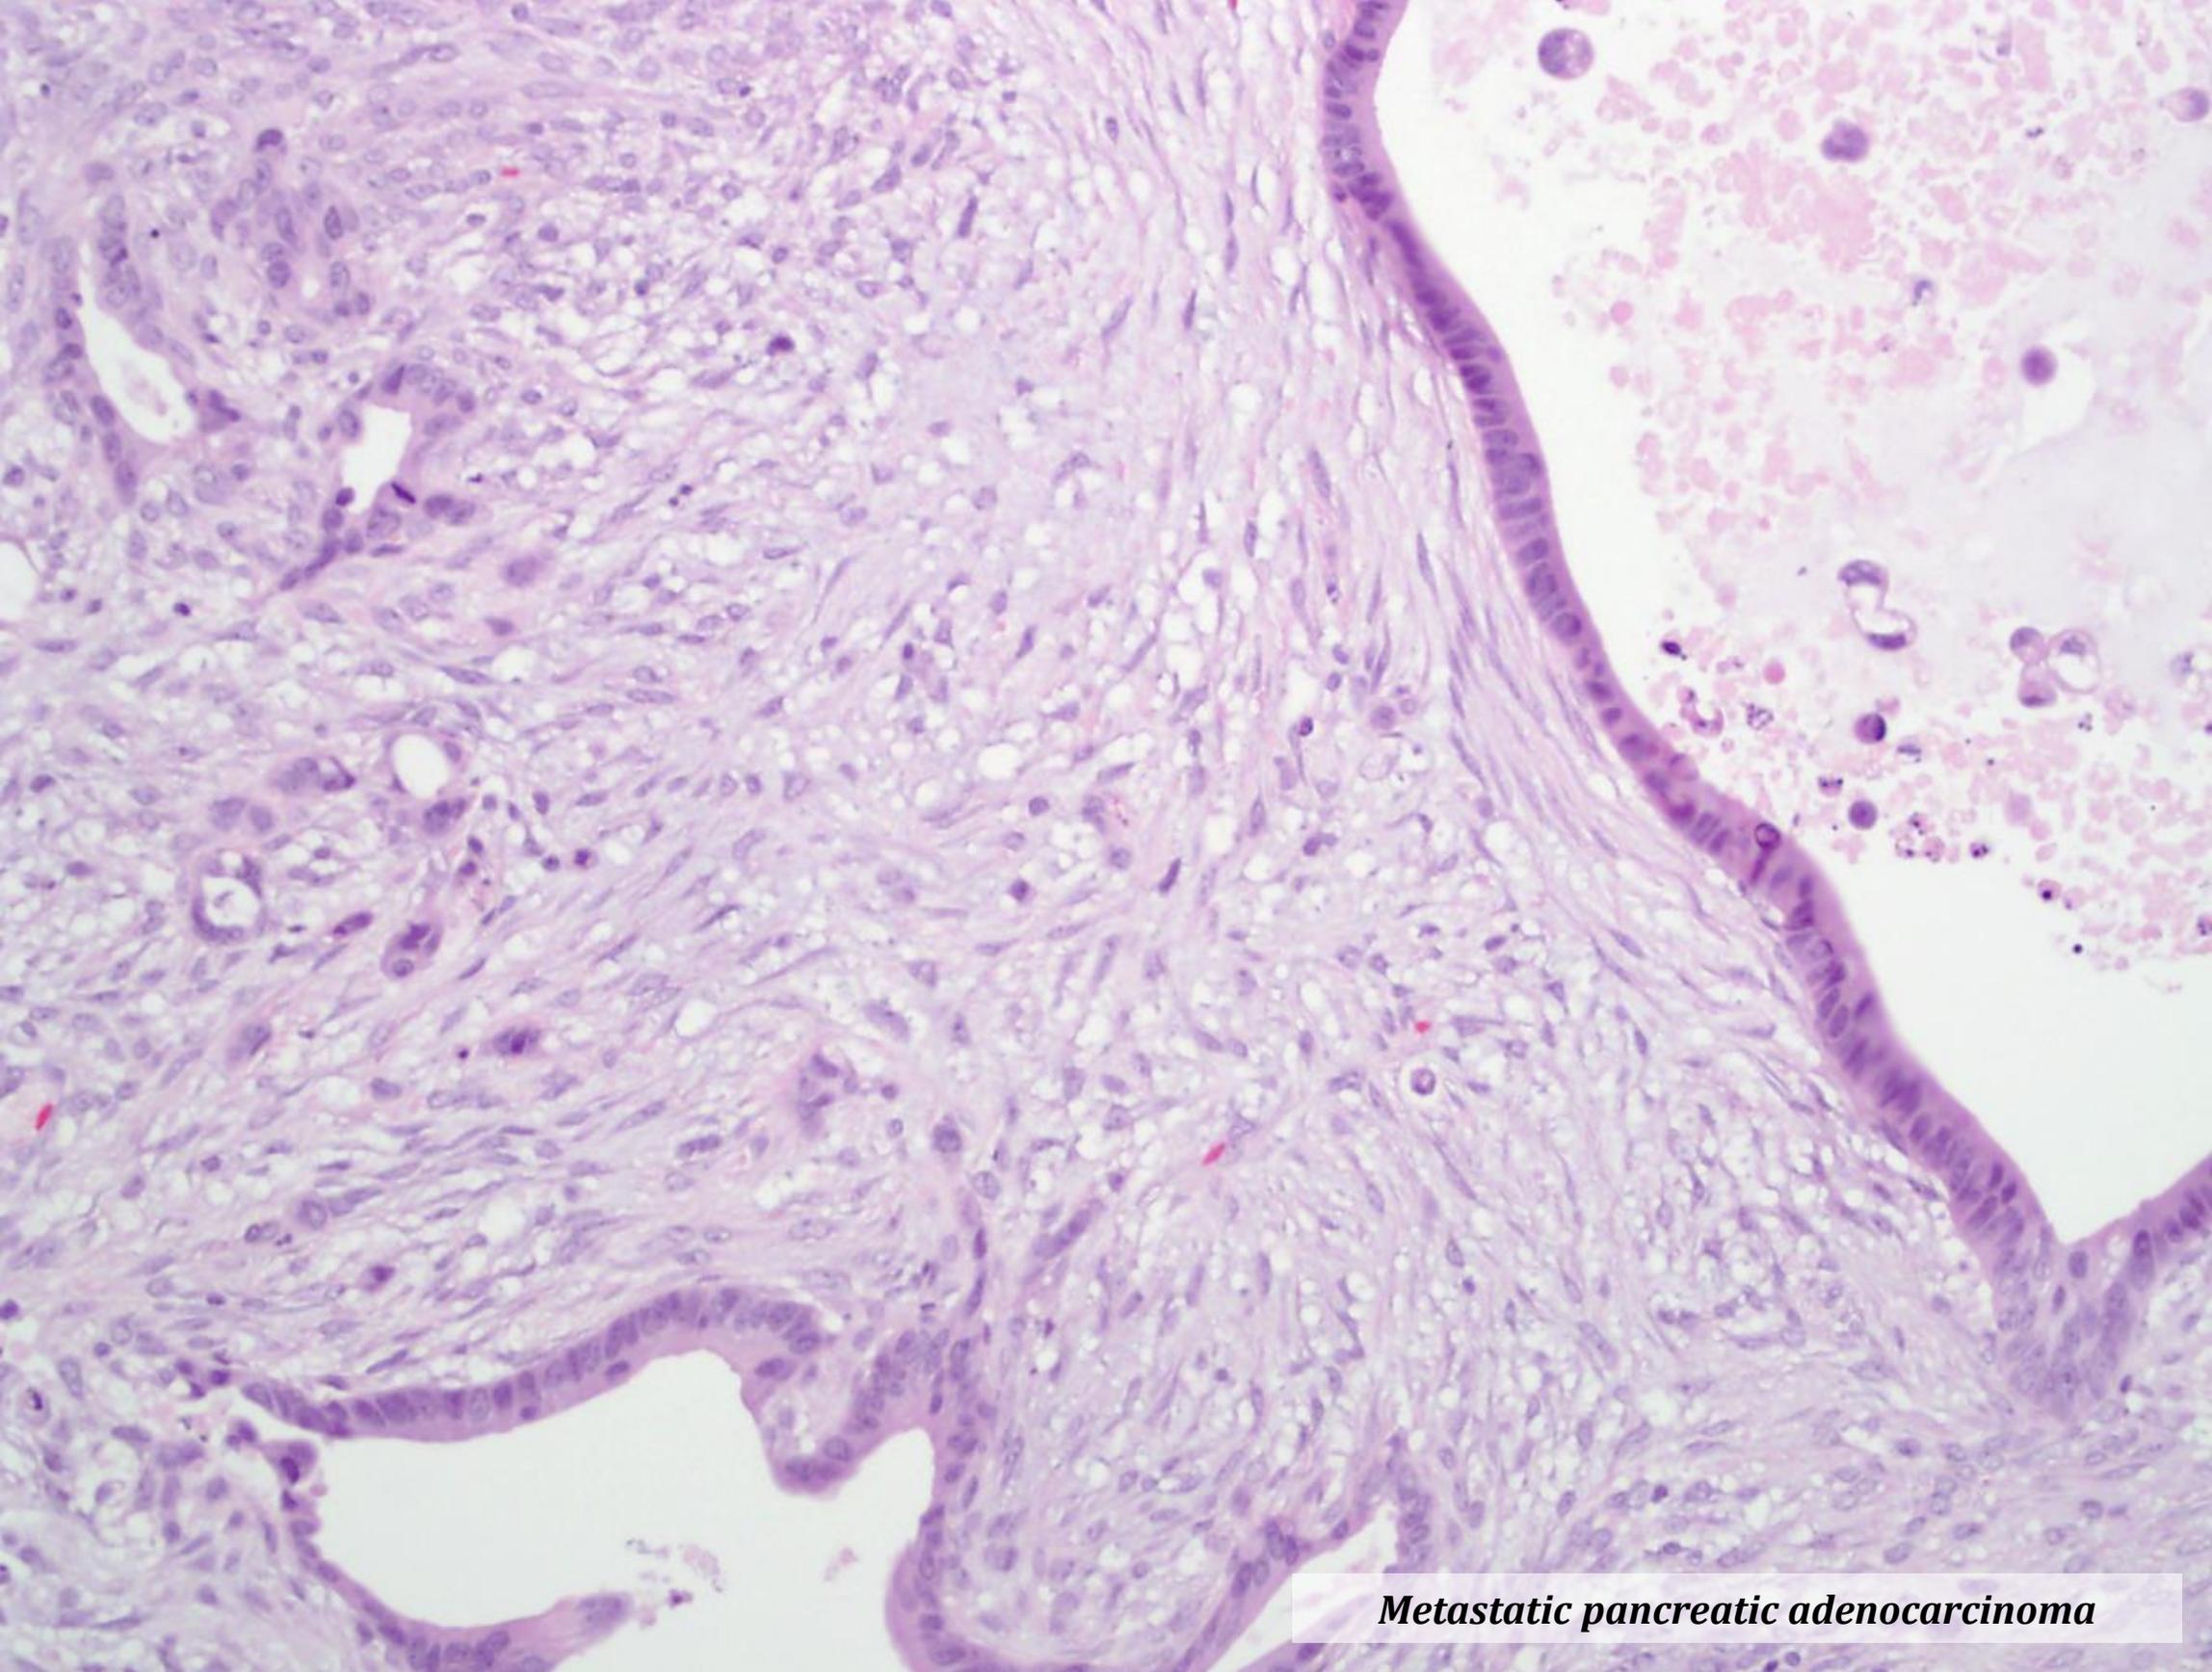

Pitfall #6

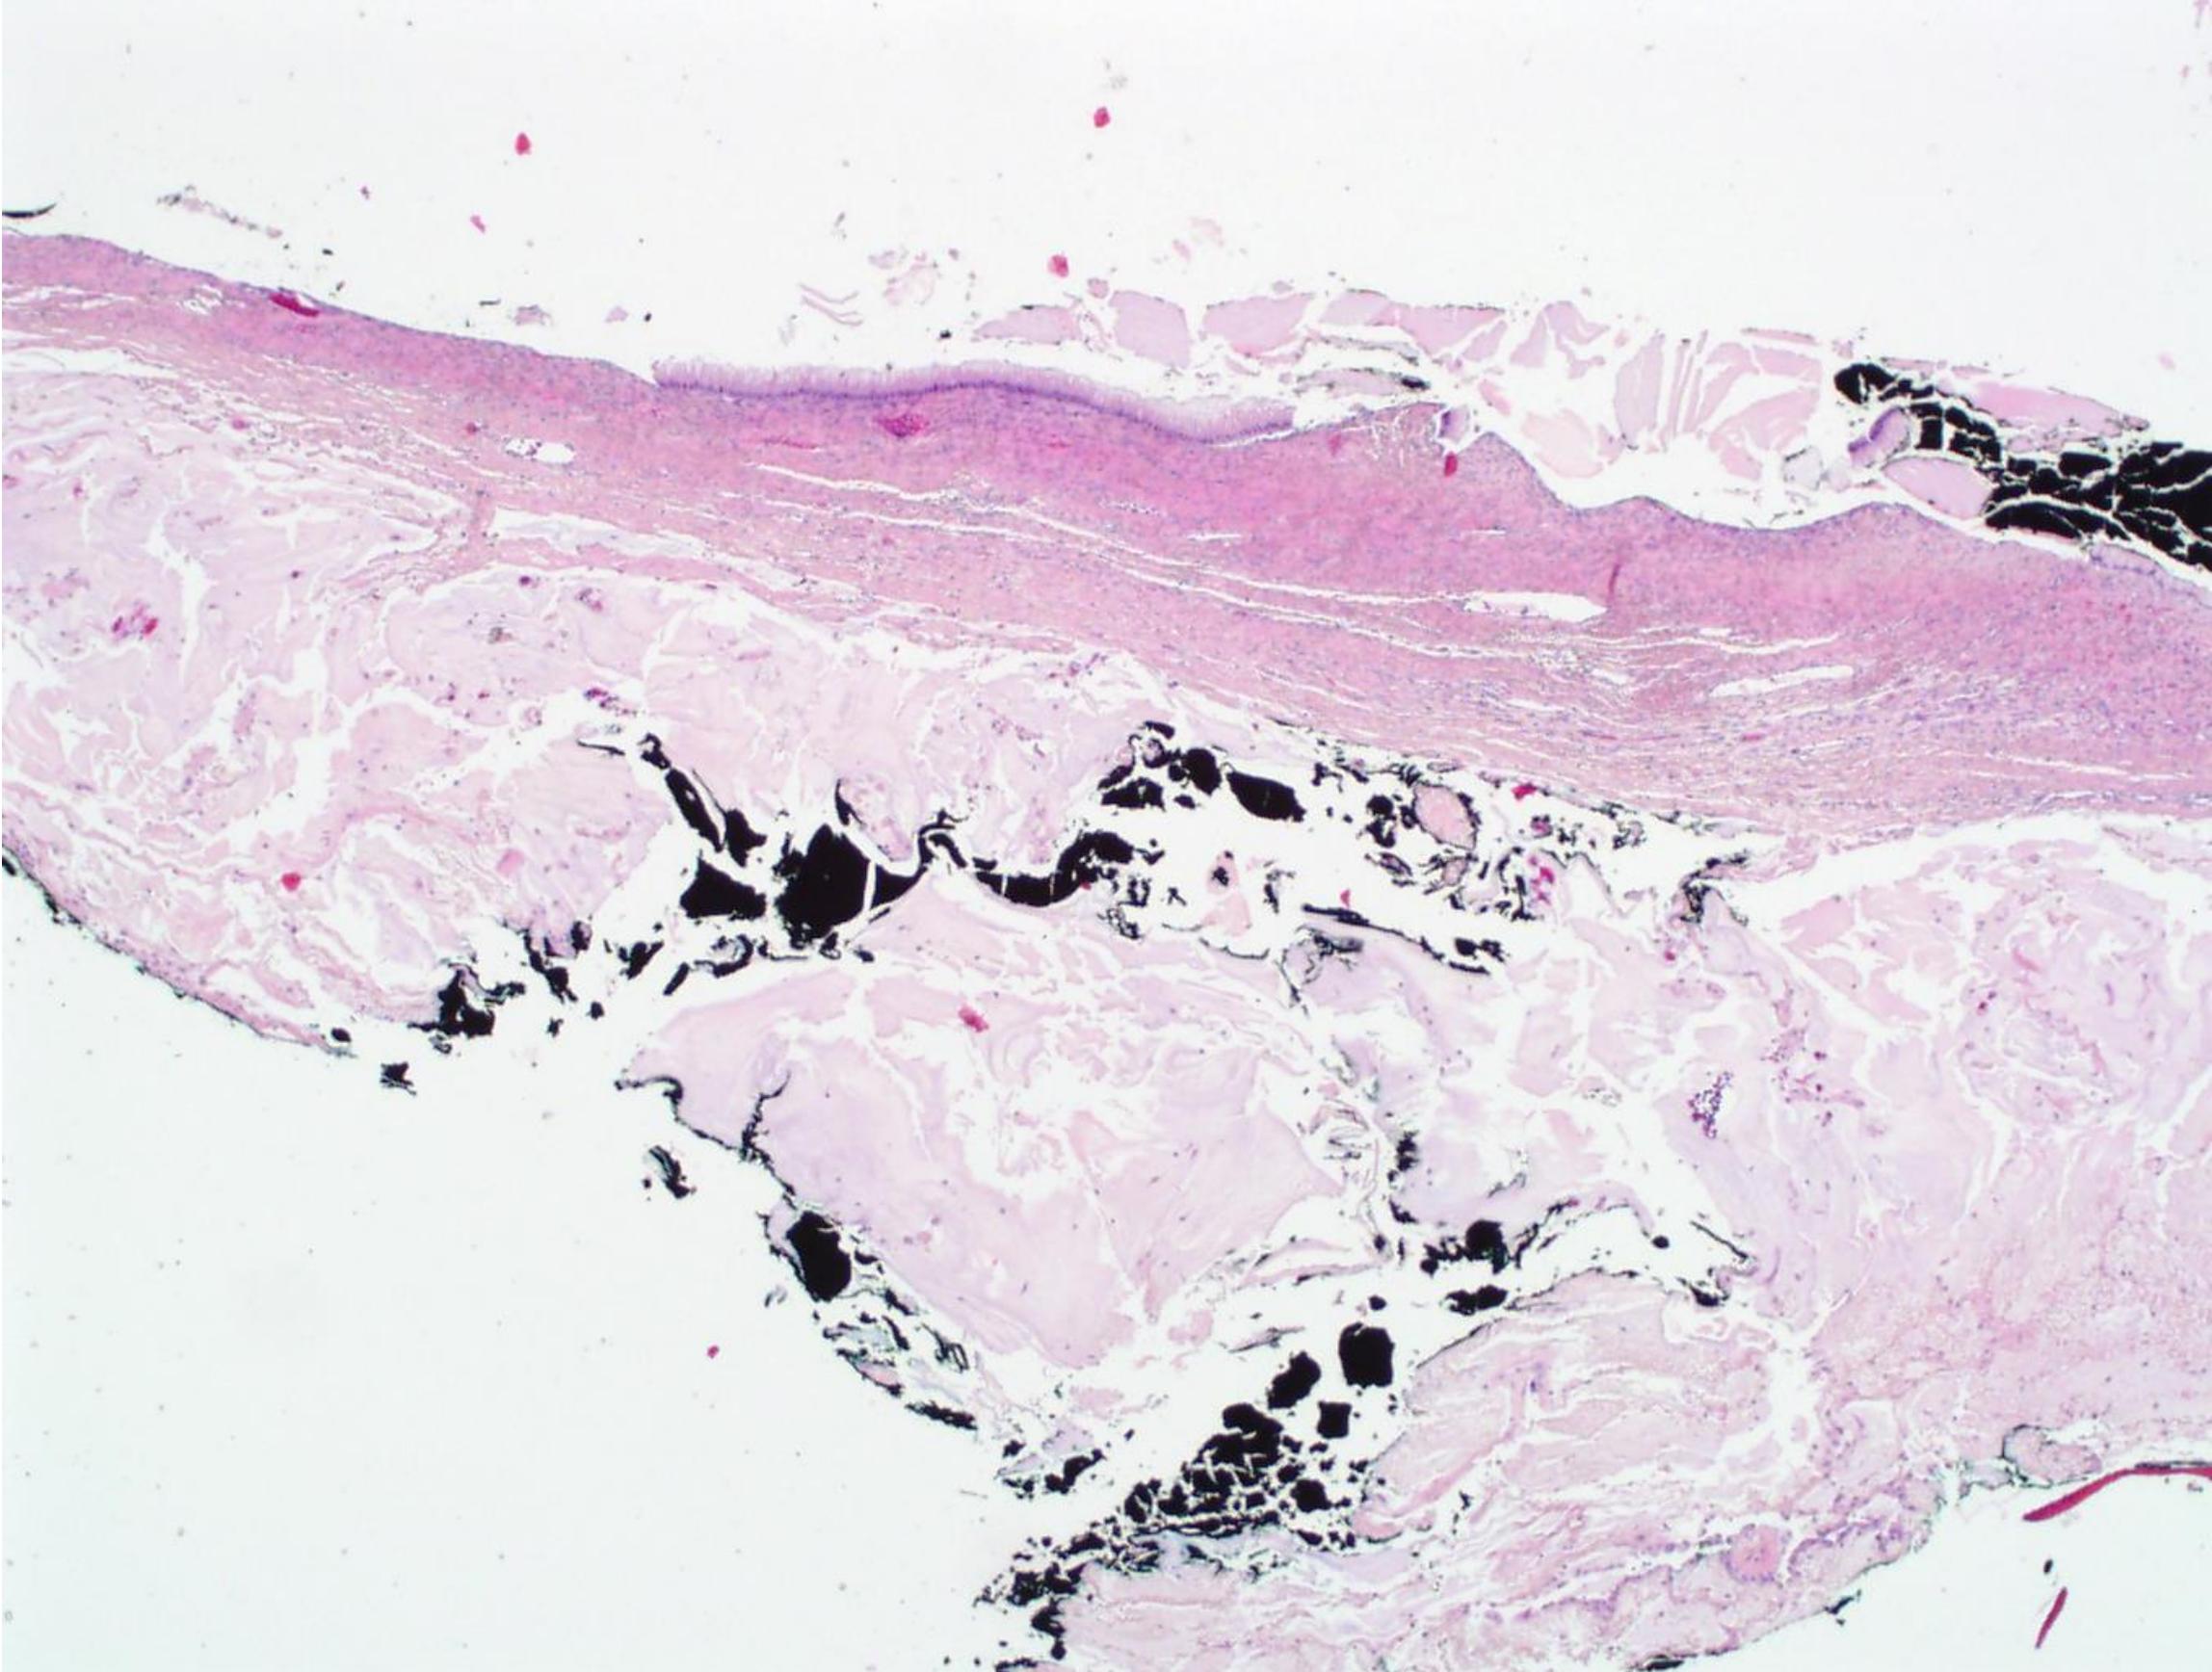

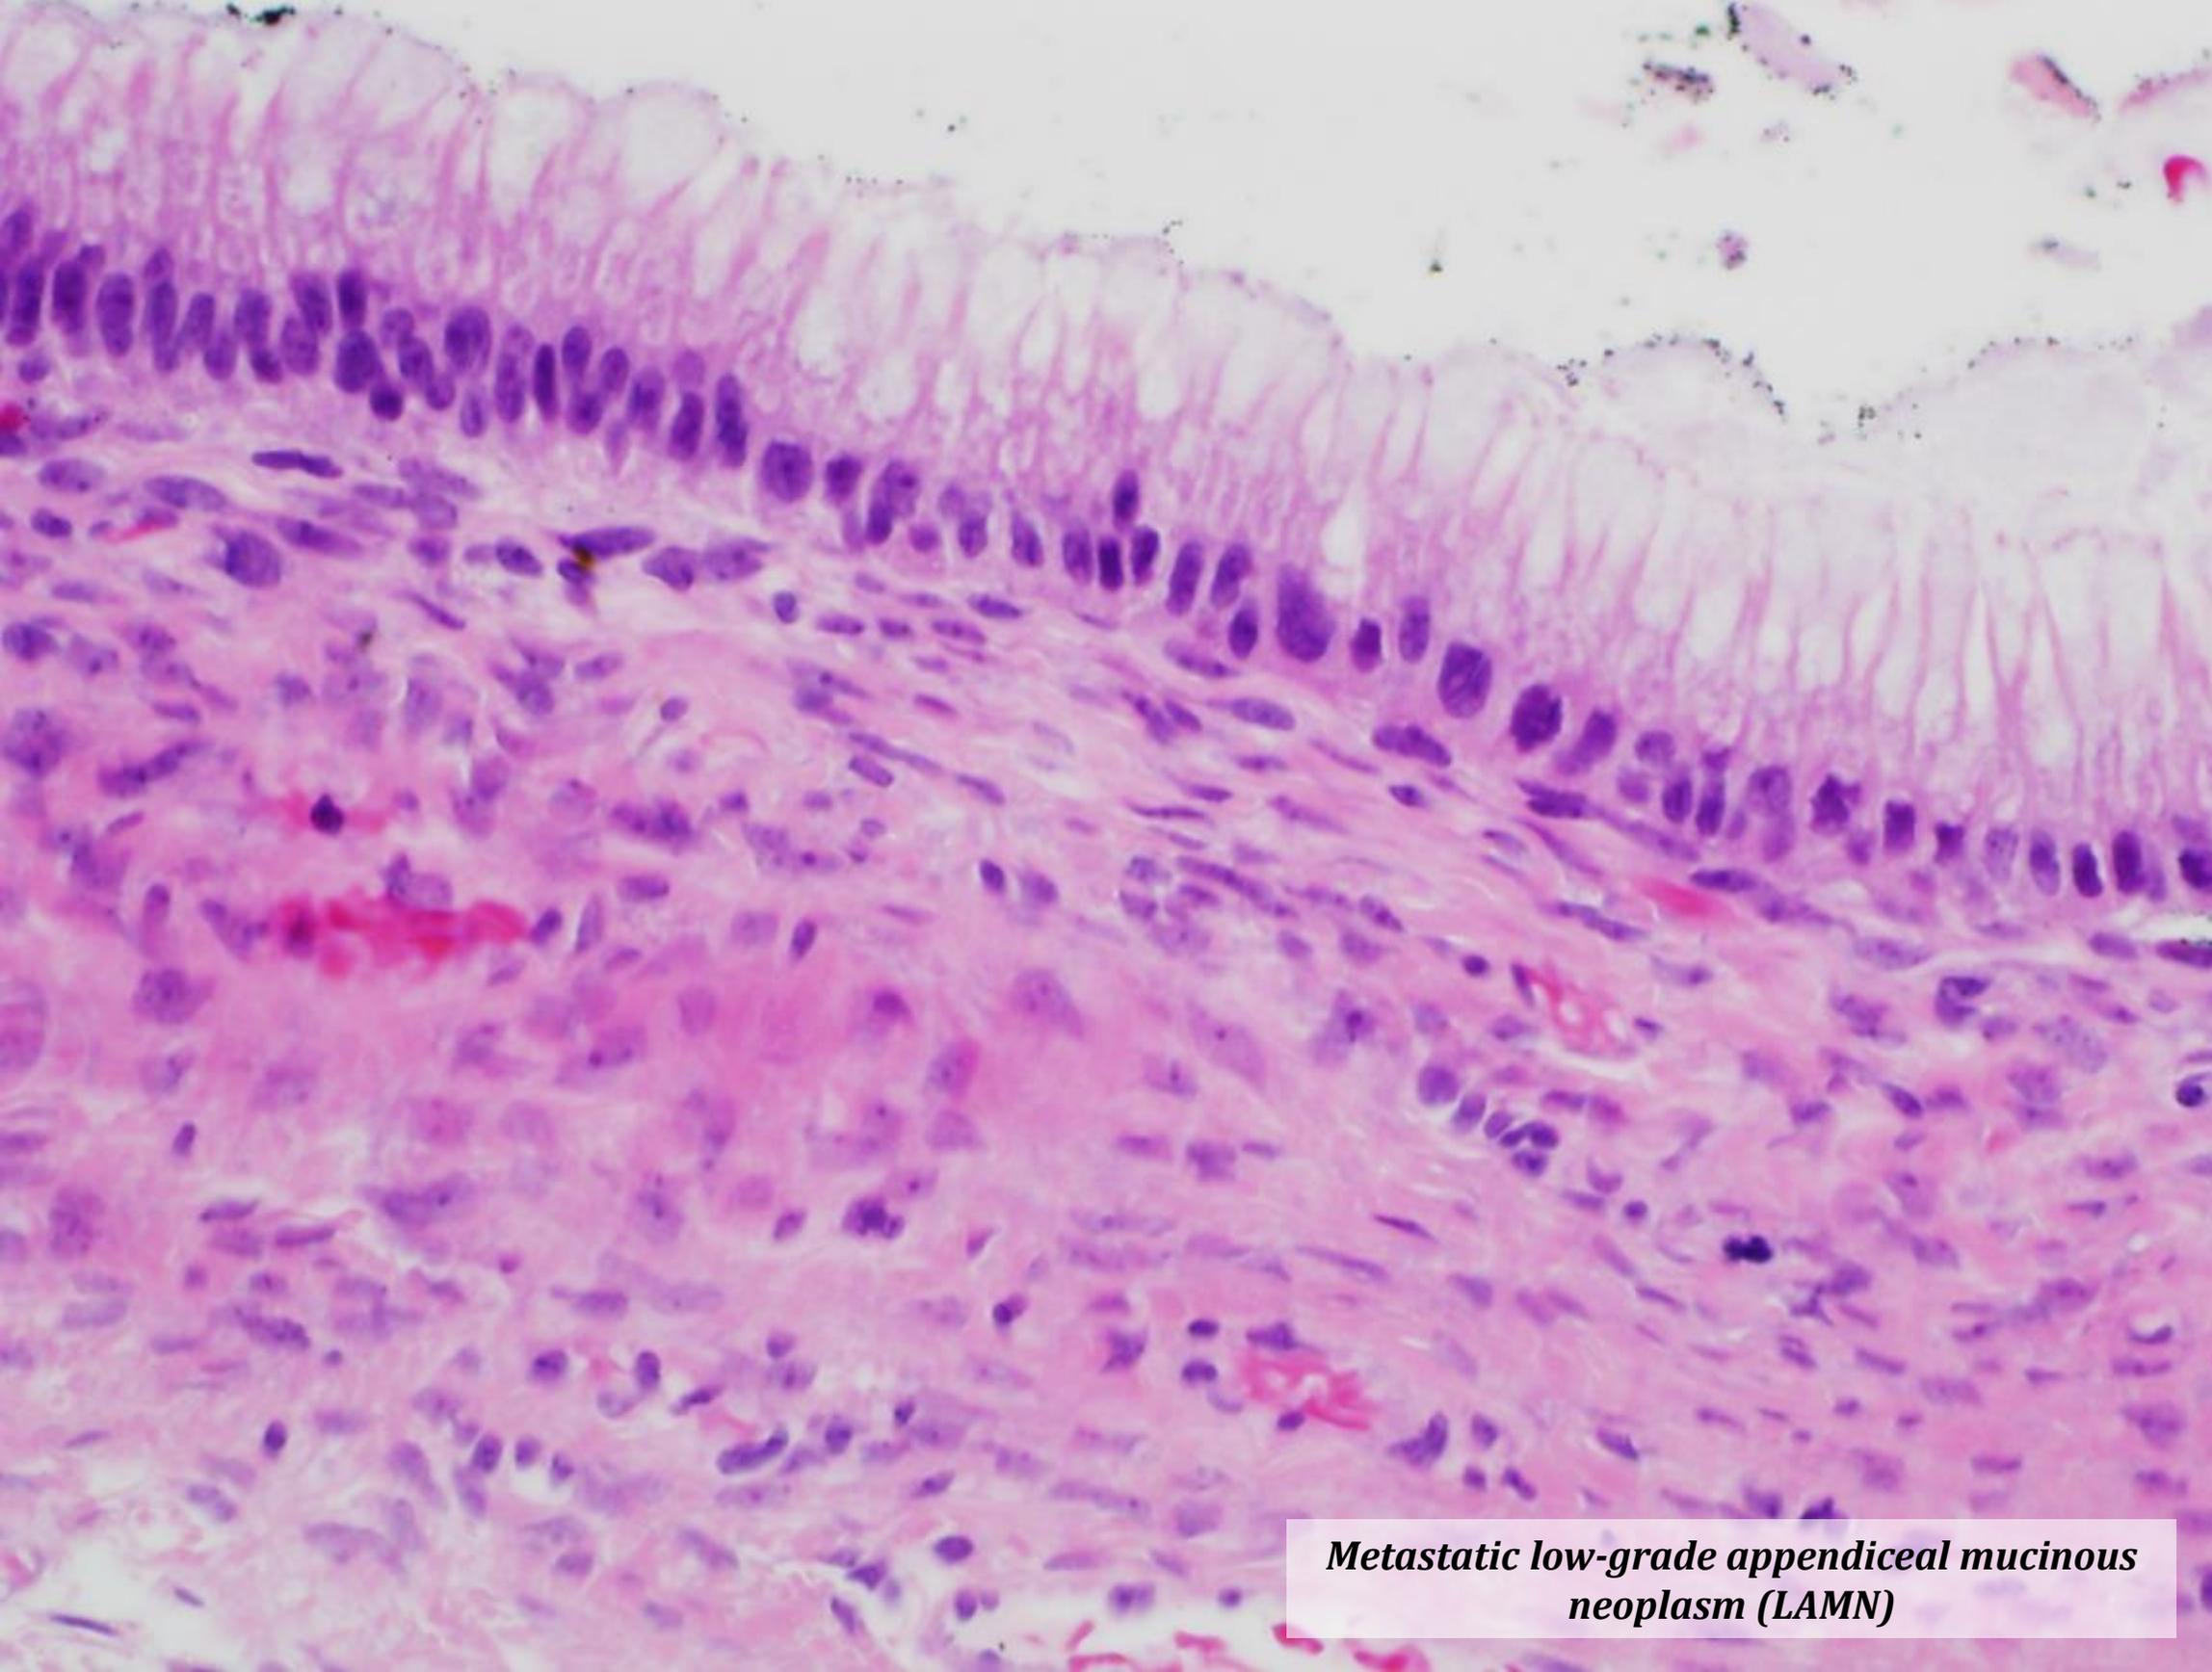

*Metastatic pancreatic adenocarcinoma
mimicking a mucinous cystadenoma*

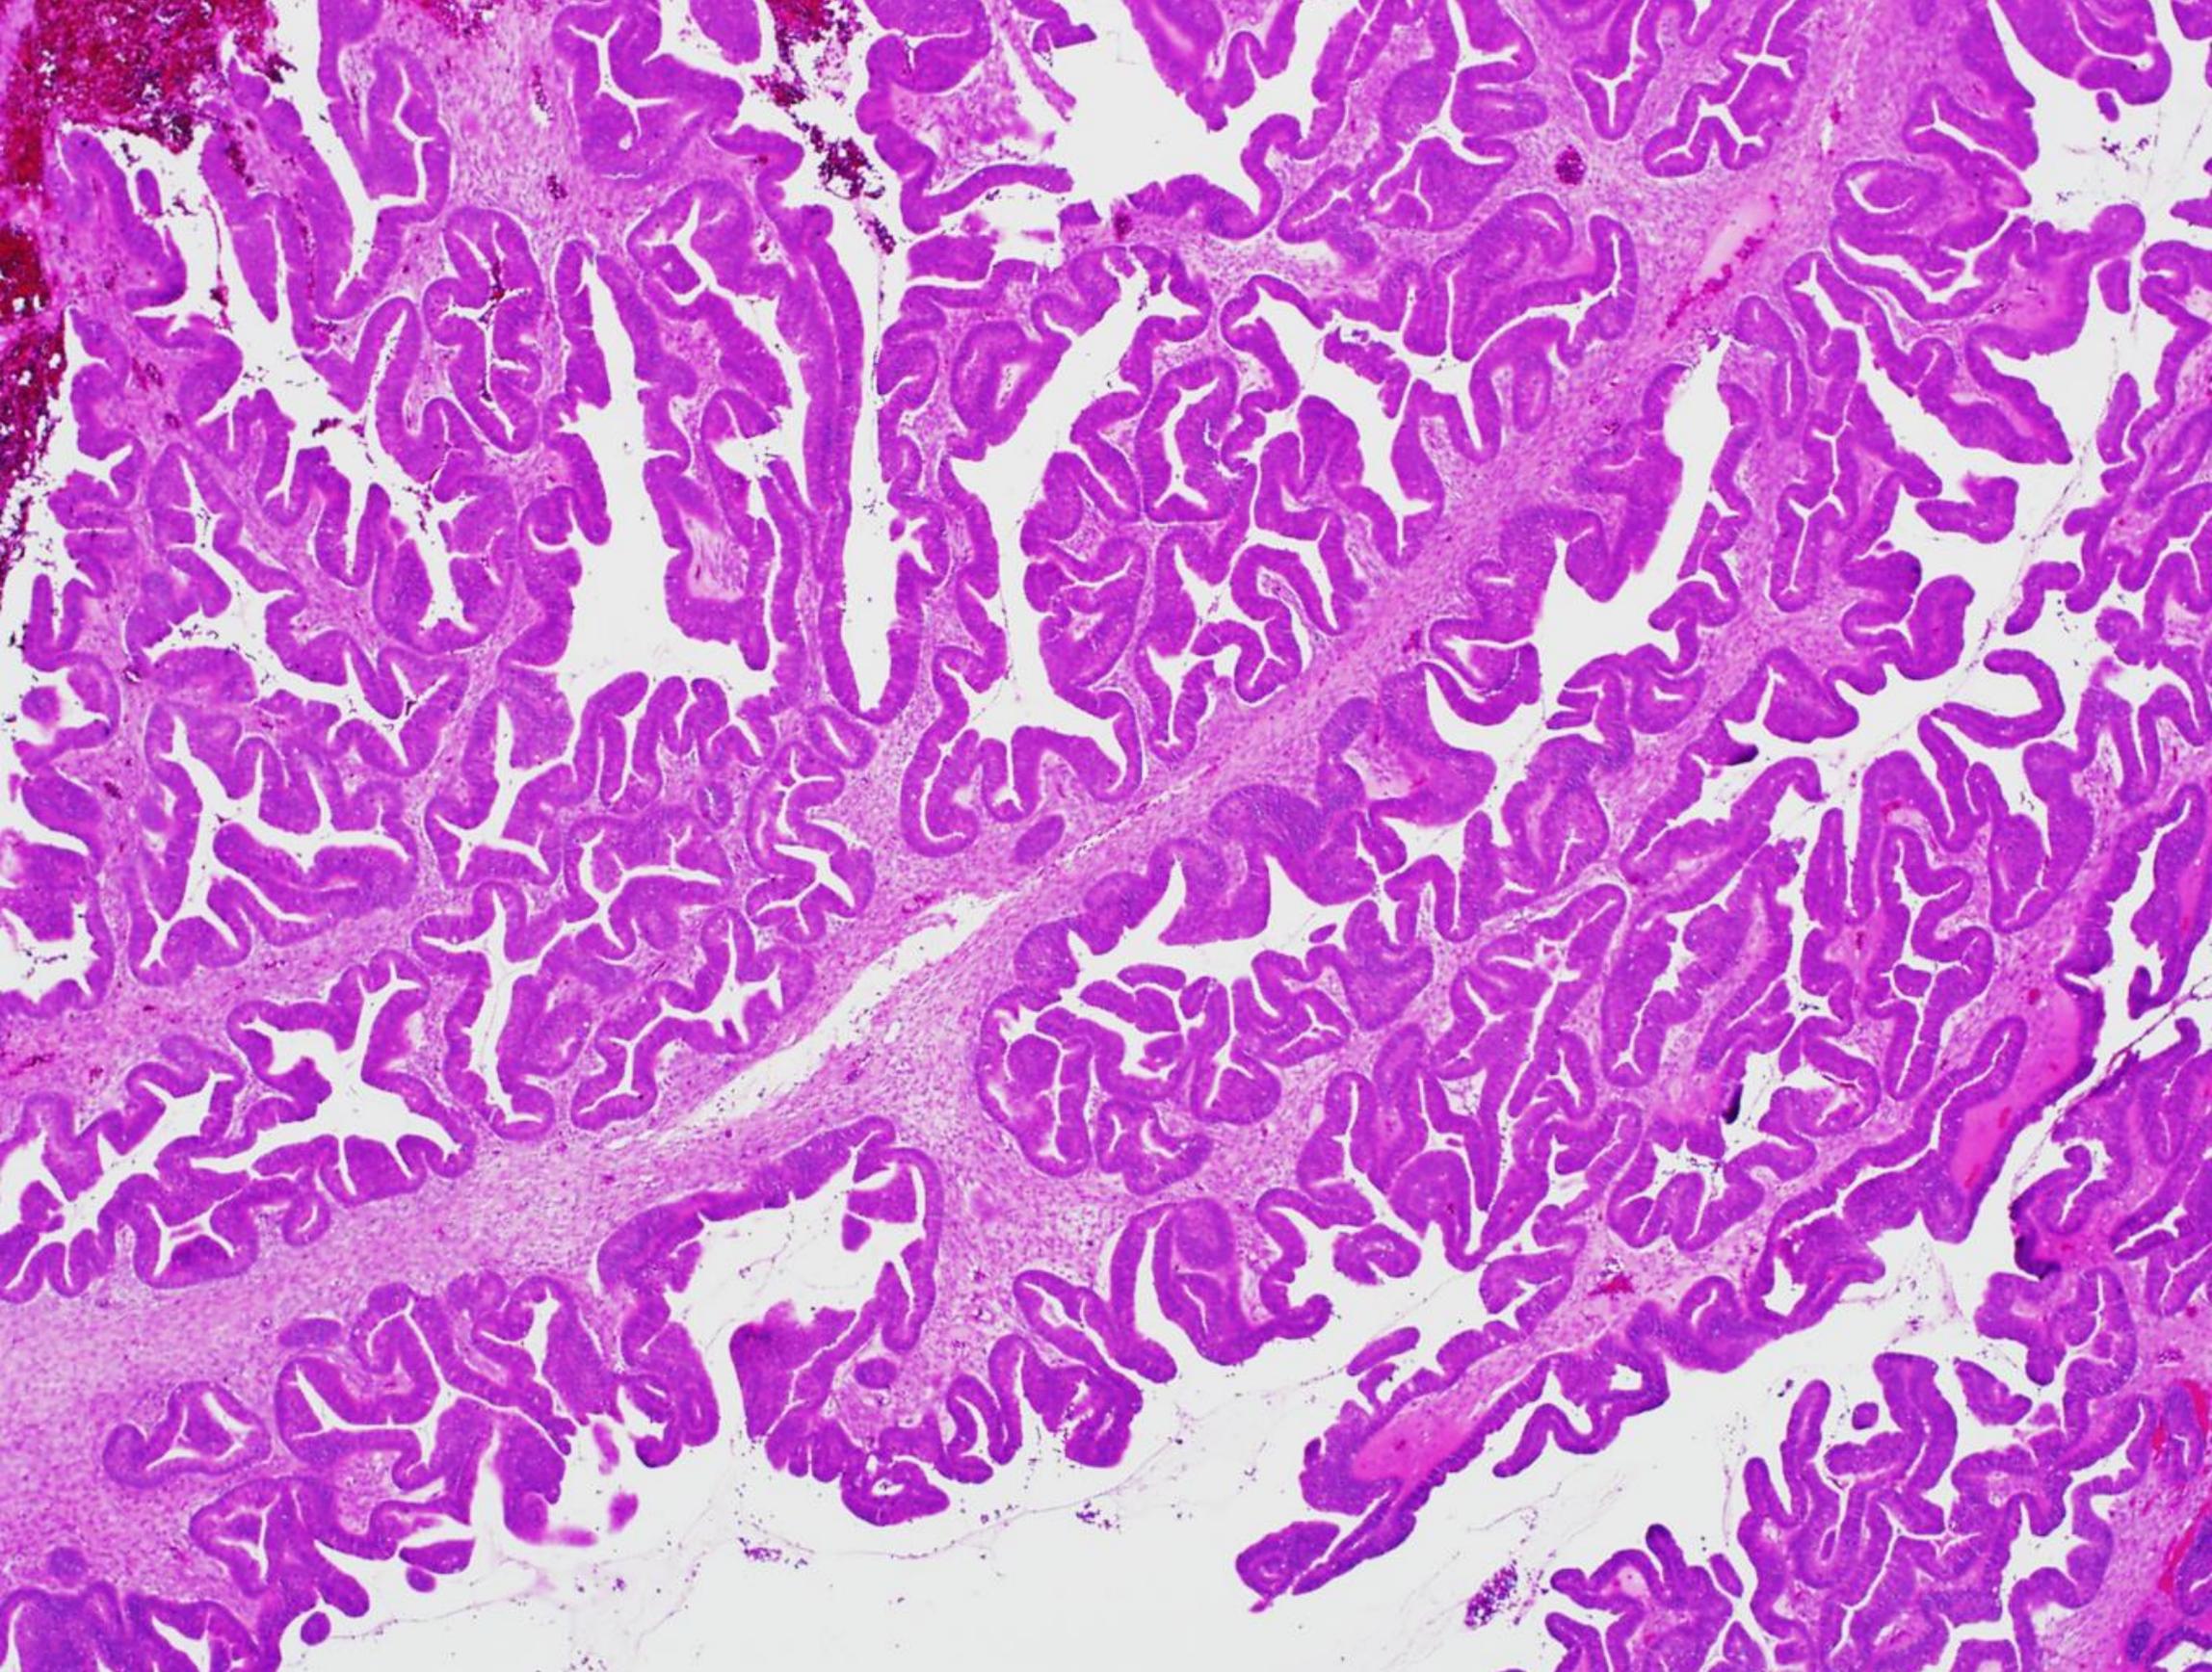

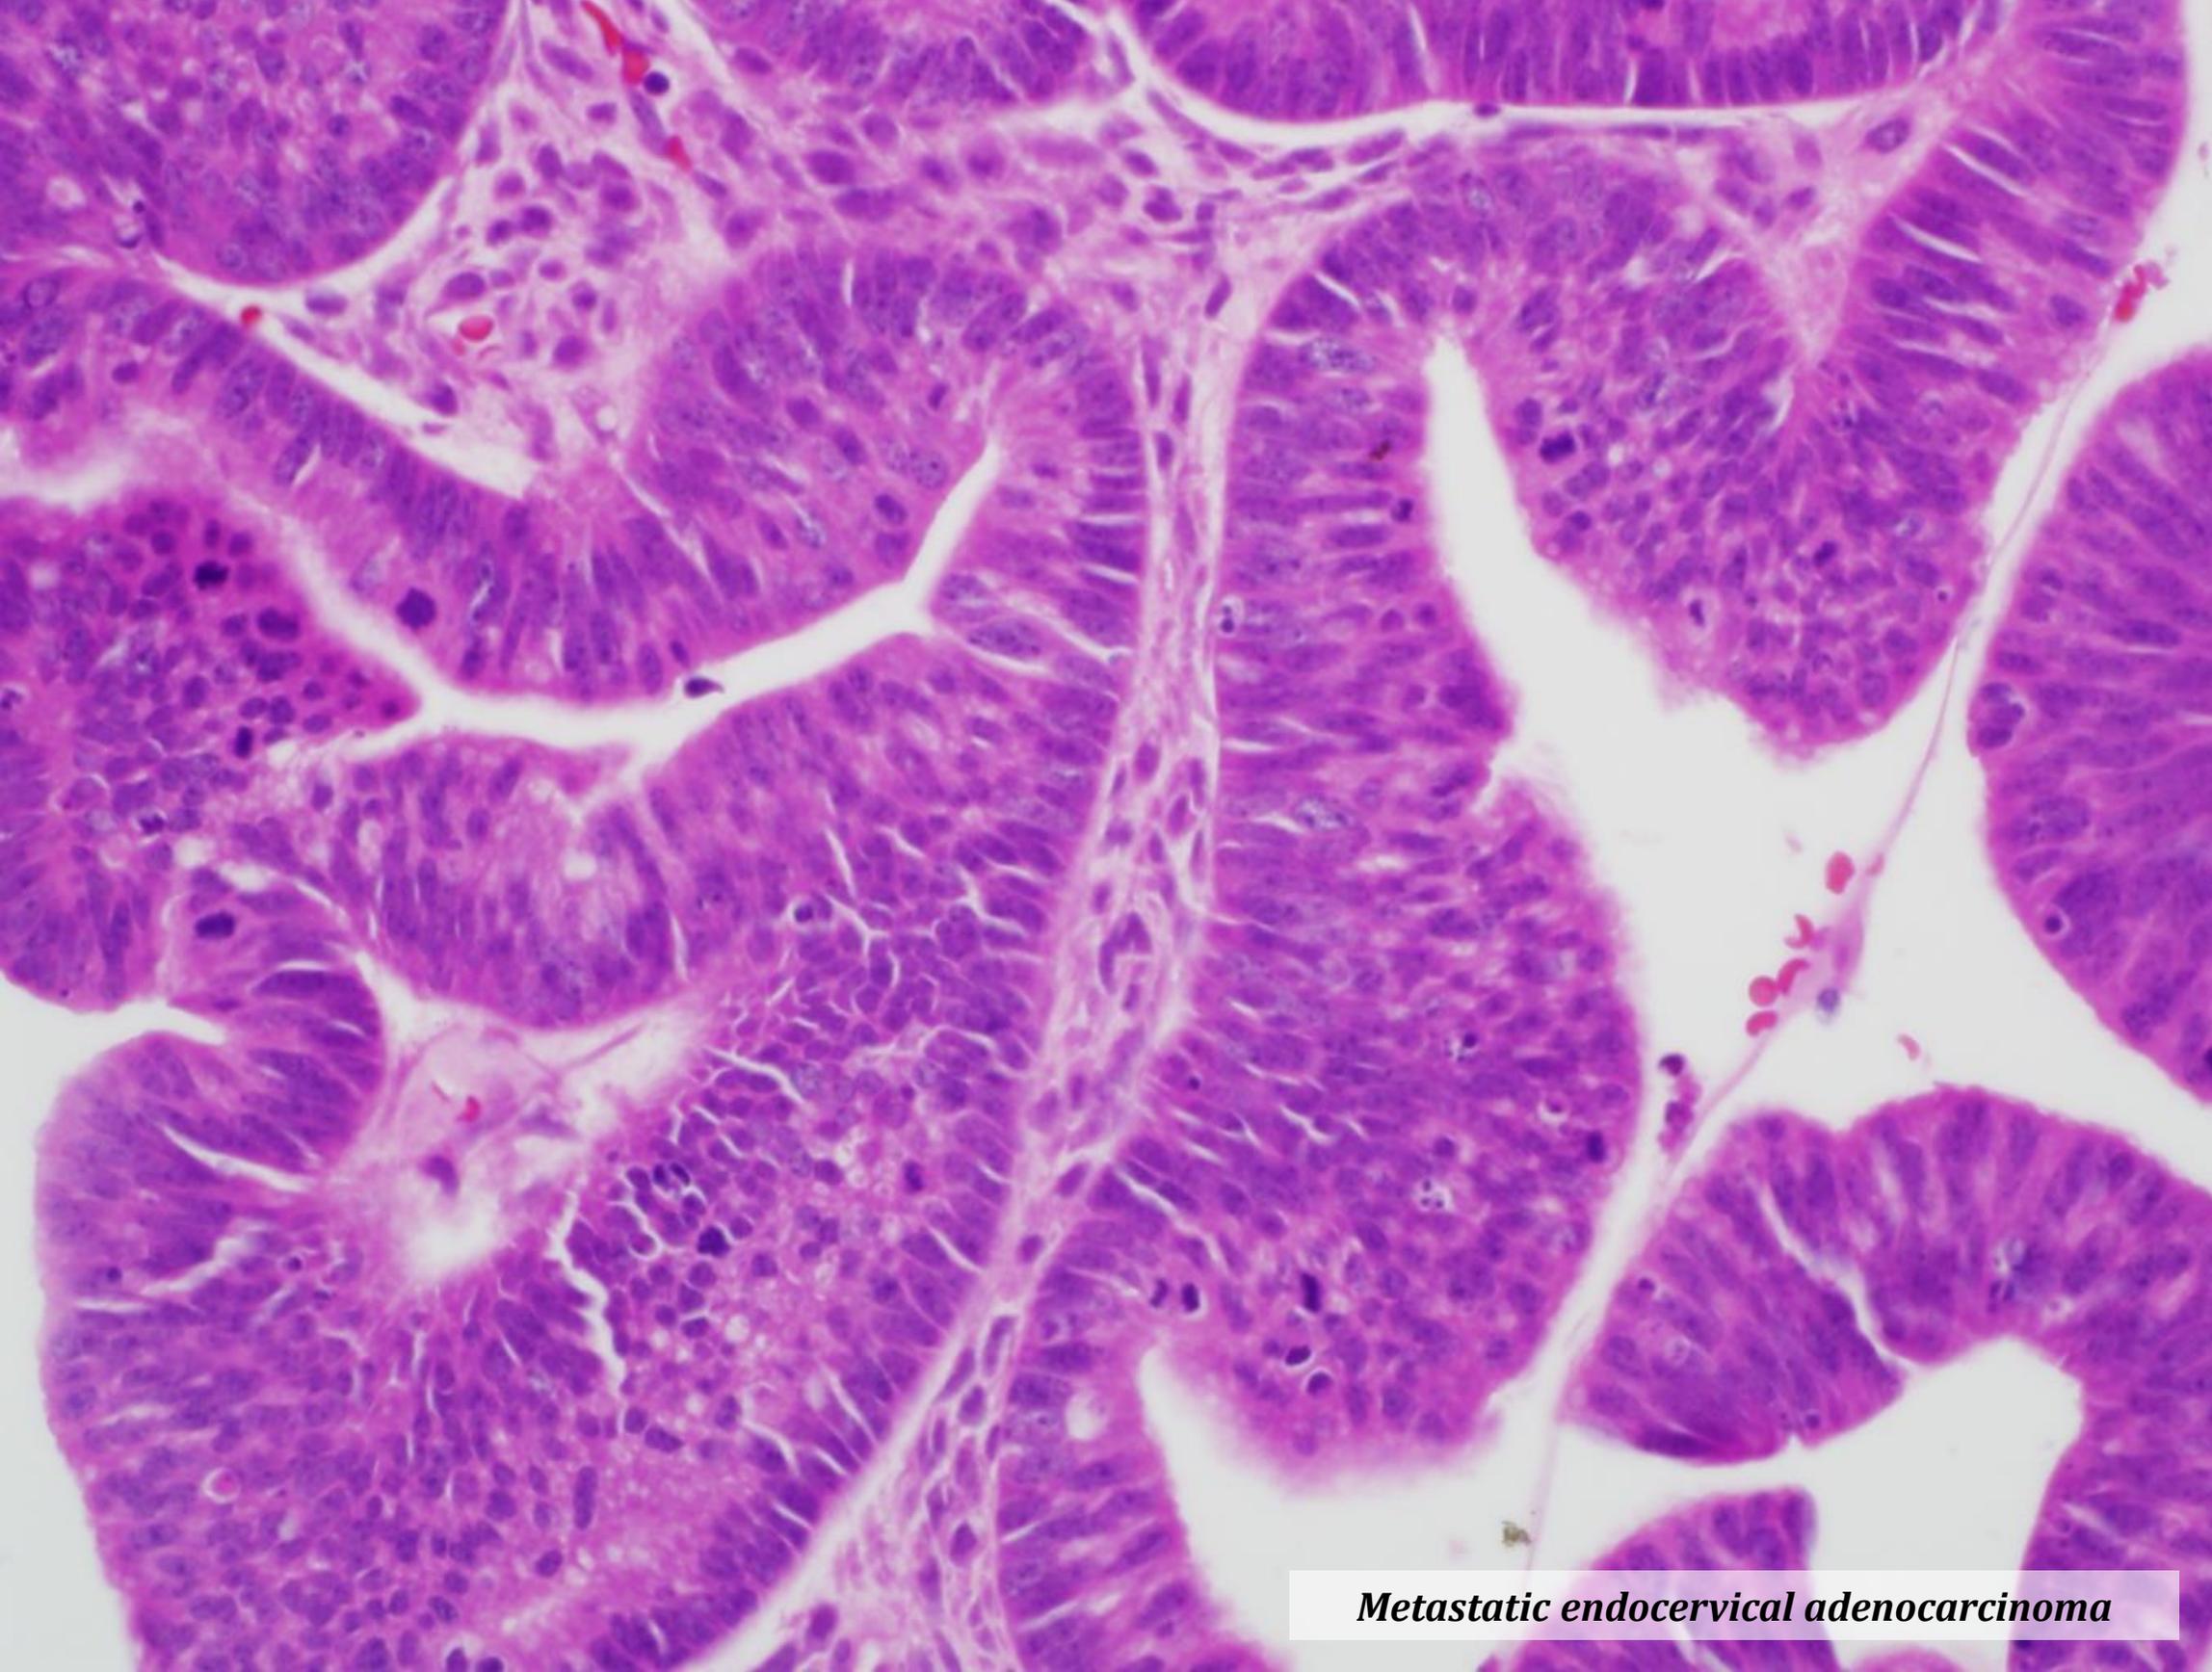

Metastatic pancreatic adenocarcinoma

Metastatic low-grade appendiceal mucinous neoplasm (LAMN)

Metastatic endocervical adenocarcinoma

MUCINOUS TUMORS

GROSS CHARACTERISTICS

- Laterality of the tumor
- Size of the tumor
- Appearance

TABLE 2. Distribution of primary/metastatic tumors based on size of largest ovary and laterality

A	<10 cm	≥10 cm
Unilateral	13% primary 87% metastatic	82% primary 18% metastatic
Bilateral	5% primary 95% metastatic	8% primary 92% metastatic
B	Primary	Metastatic
Unilateral ≥10 cm	9	2
Unilateral <10 cm	1	7
Bilateral ≥10 cm	1	11
Bilateral <10 cm	1	18

Note: The above data do not include two tumors with unknown laterality or unknown size (both metastatic).

TABLE 4. Primary and Metastatic Mucinous Tumors: Size and Laterality Data (All Cases Combined)

Tumor Type	n	Size (cm)			Bilateral (%)
		Mean	Median	Range	
Primary ovarian mucinous tumors (total)	52	21.9	21.0	12.0-36.0	0
Atypical proliferative (borderline) mucinous tumors	31	22.1	22.0	12.0-35.0	0
Mucinous carcinomas	21	21.5	20.0	13.0-36.0	0
Metastatic mucinous tumors (total)	142	13.0	12.0	2.1-45.0	65
Colorectal carcinomas	46	13.6	13.0	2.5-45.0	57
Appendiceal tumors					
Low-grade tumors	28	16.0	18.0	3.0-30.0	75
Carcinomas	20	12.0	10.9	3.5-24.0	90
Pancreaticobiliary tract carcinomas	20	9.8	9.8	2.5-21.0	90
Small intestinal carcinomas	3	15.8	15.0	12.5-20.0	33
Gastric carcinomas	5	9.9	9.0	6.0-15.0	40
Endocervical carcinomas	20	12.2	12.3	2.1-30.0	35

METASTASIS

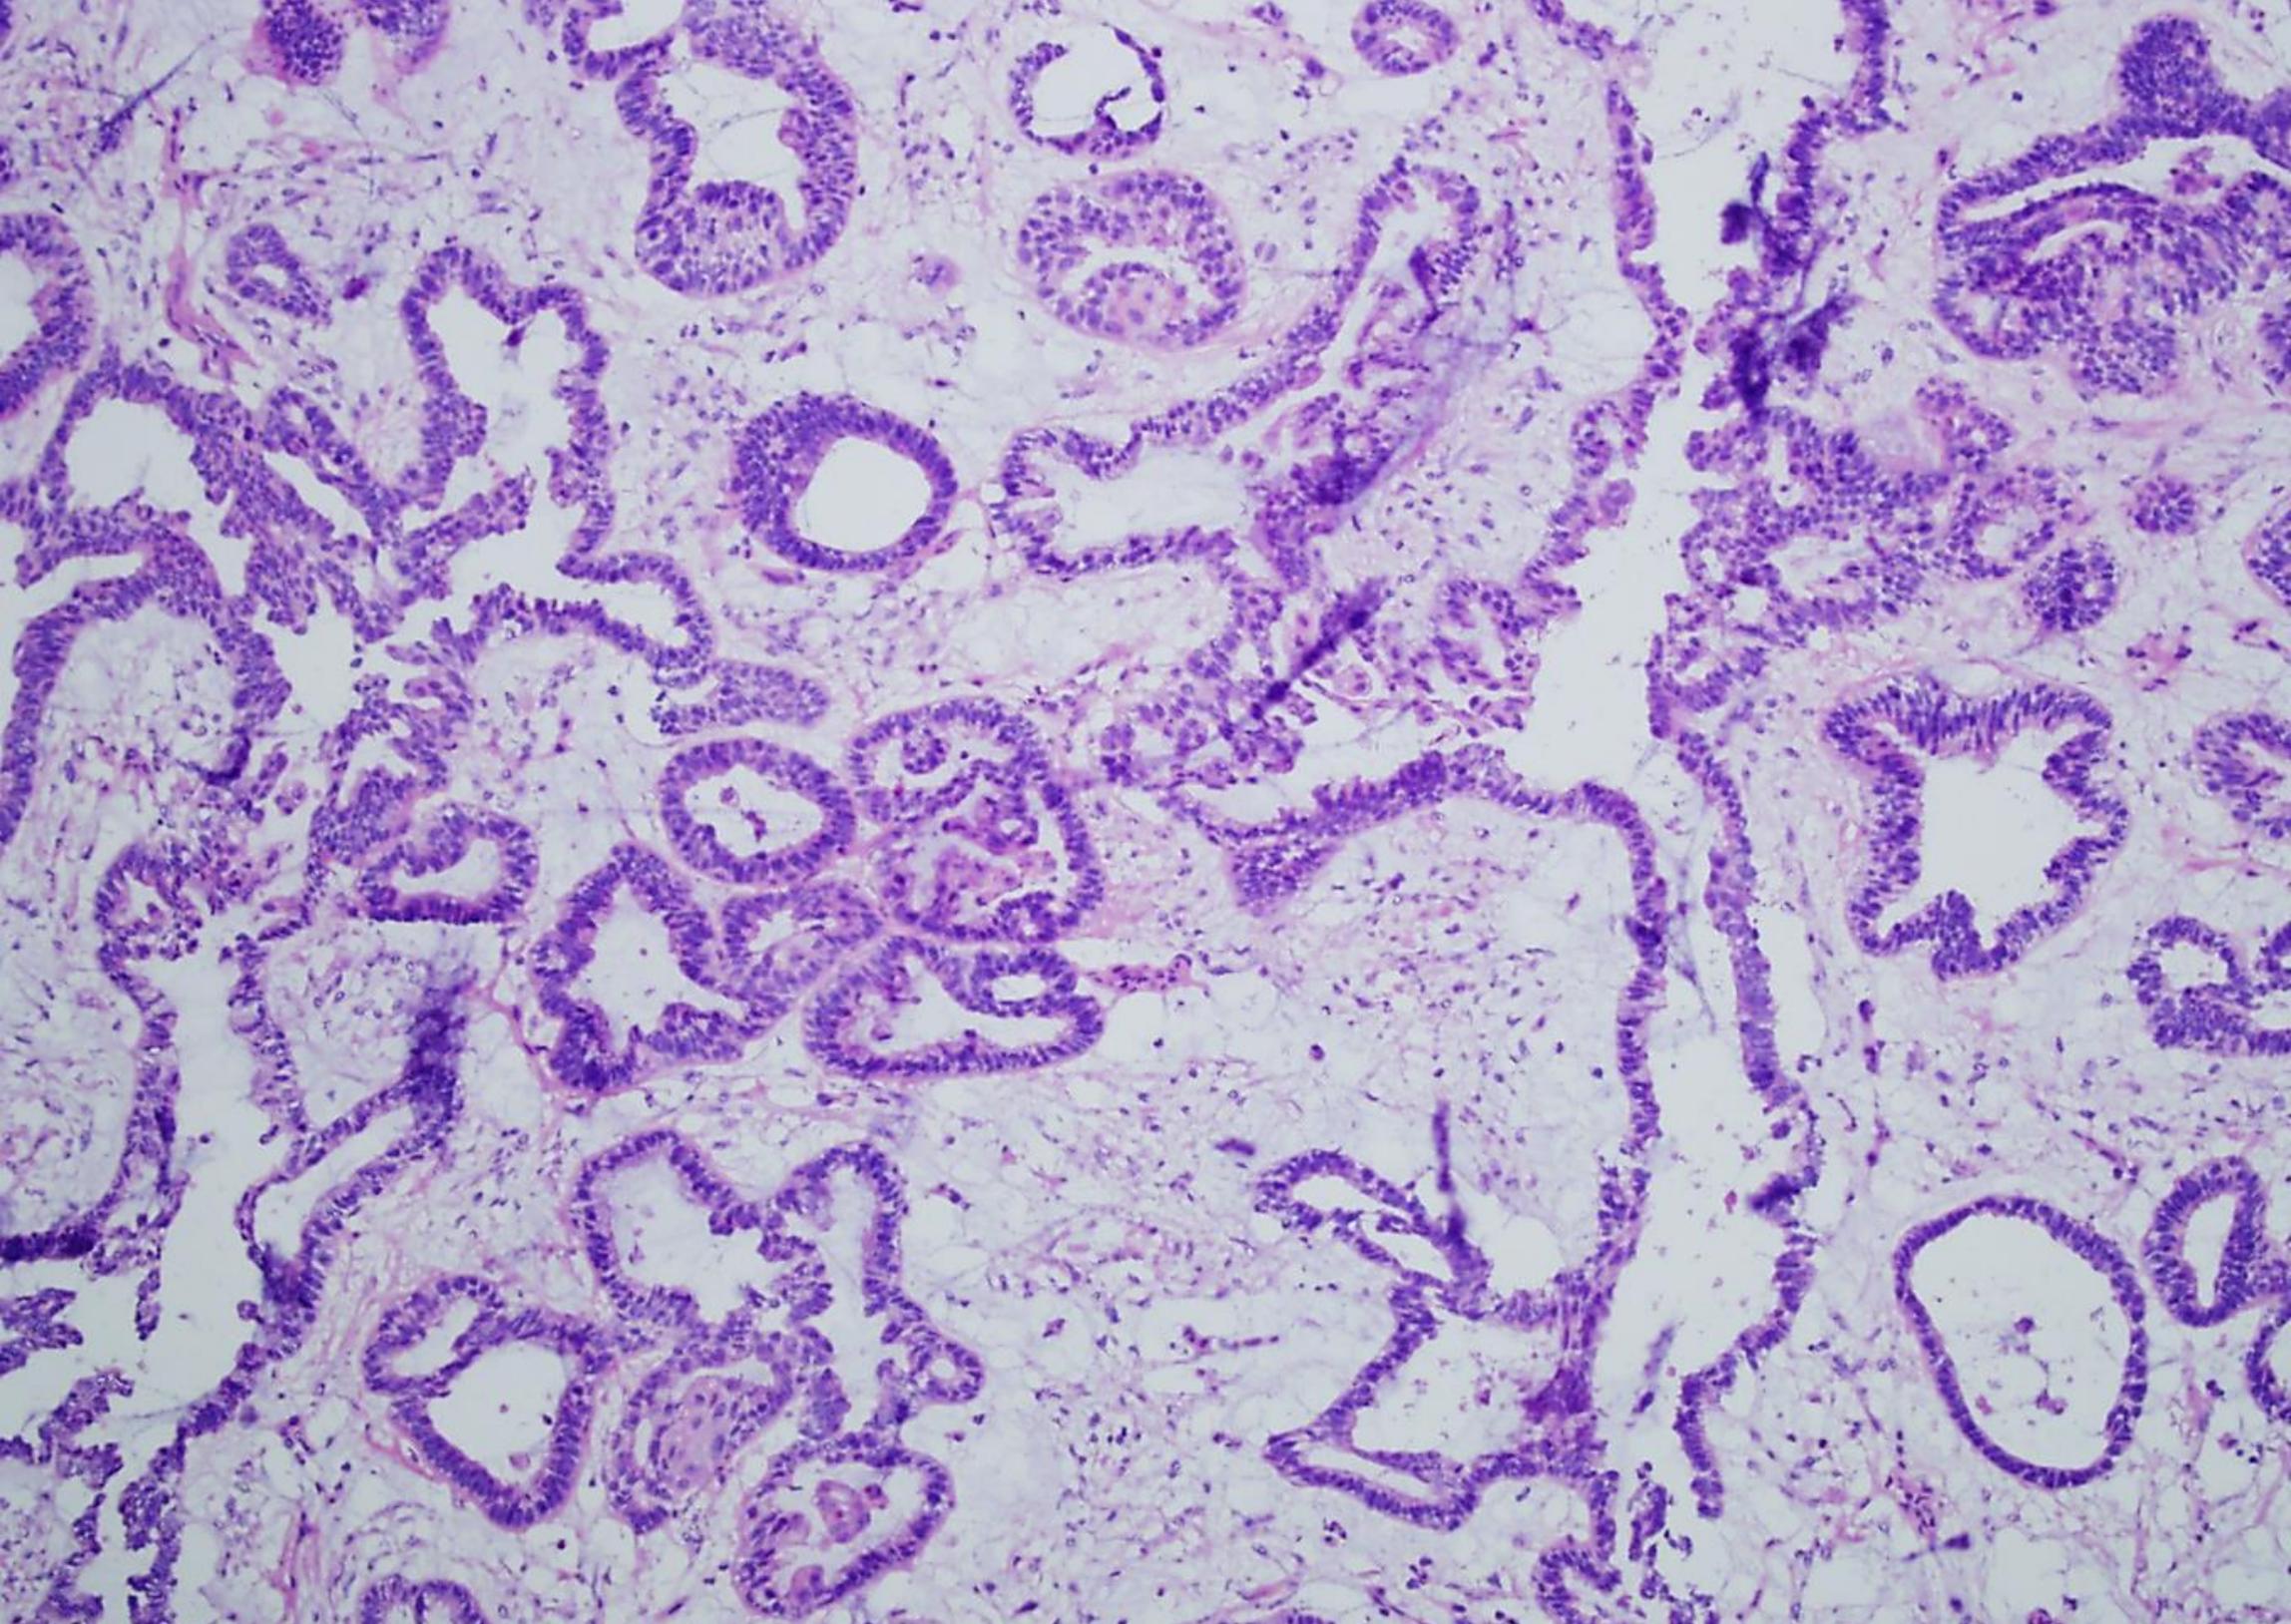

ARCHITECTURAL AND HISTOLOGIC CHARACTERISTICS

- Multinodular growth
- “Hypermucinous”, pseudomyxoma ovarii
- Discrepant cytology:architecture
 - i.e. high-grade cytology with well differentiated architecture

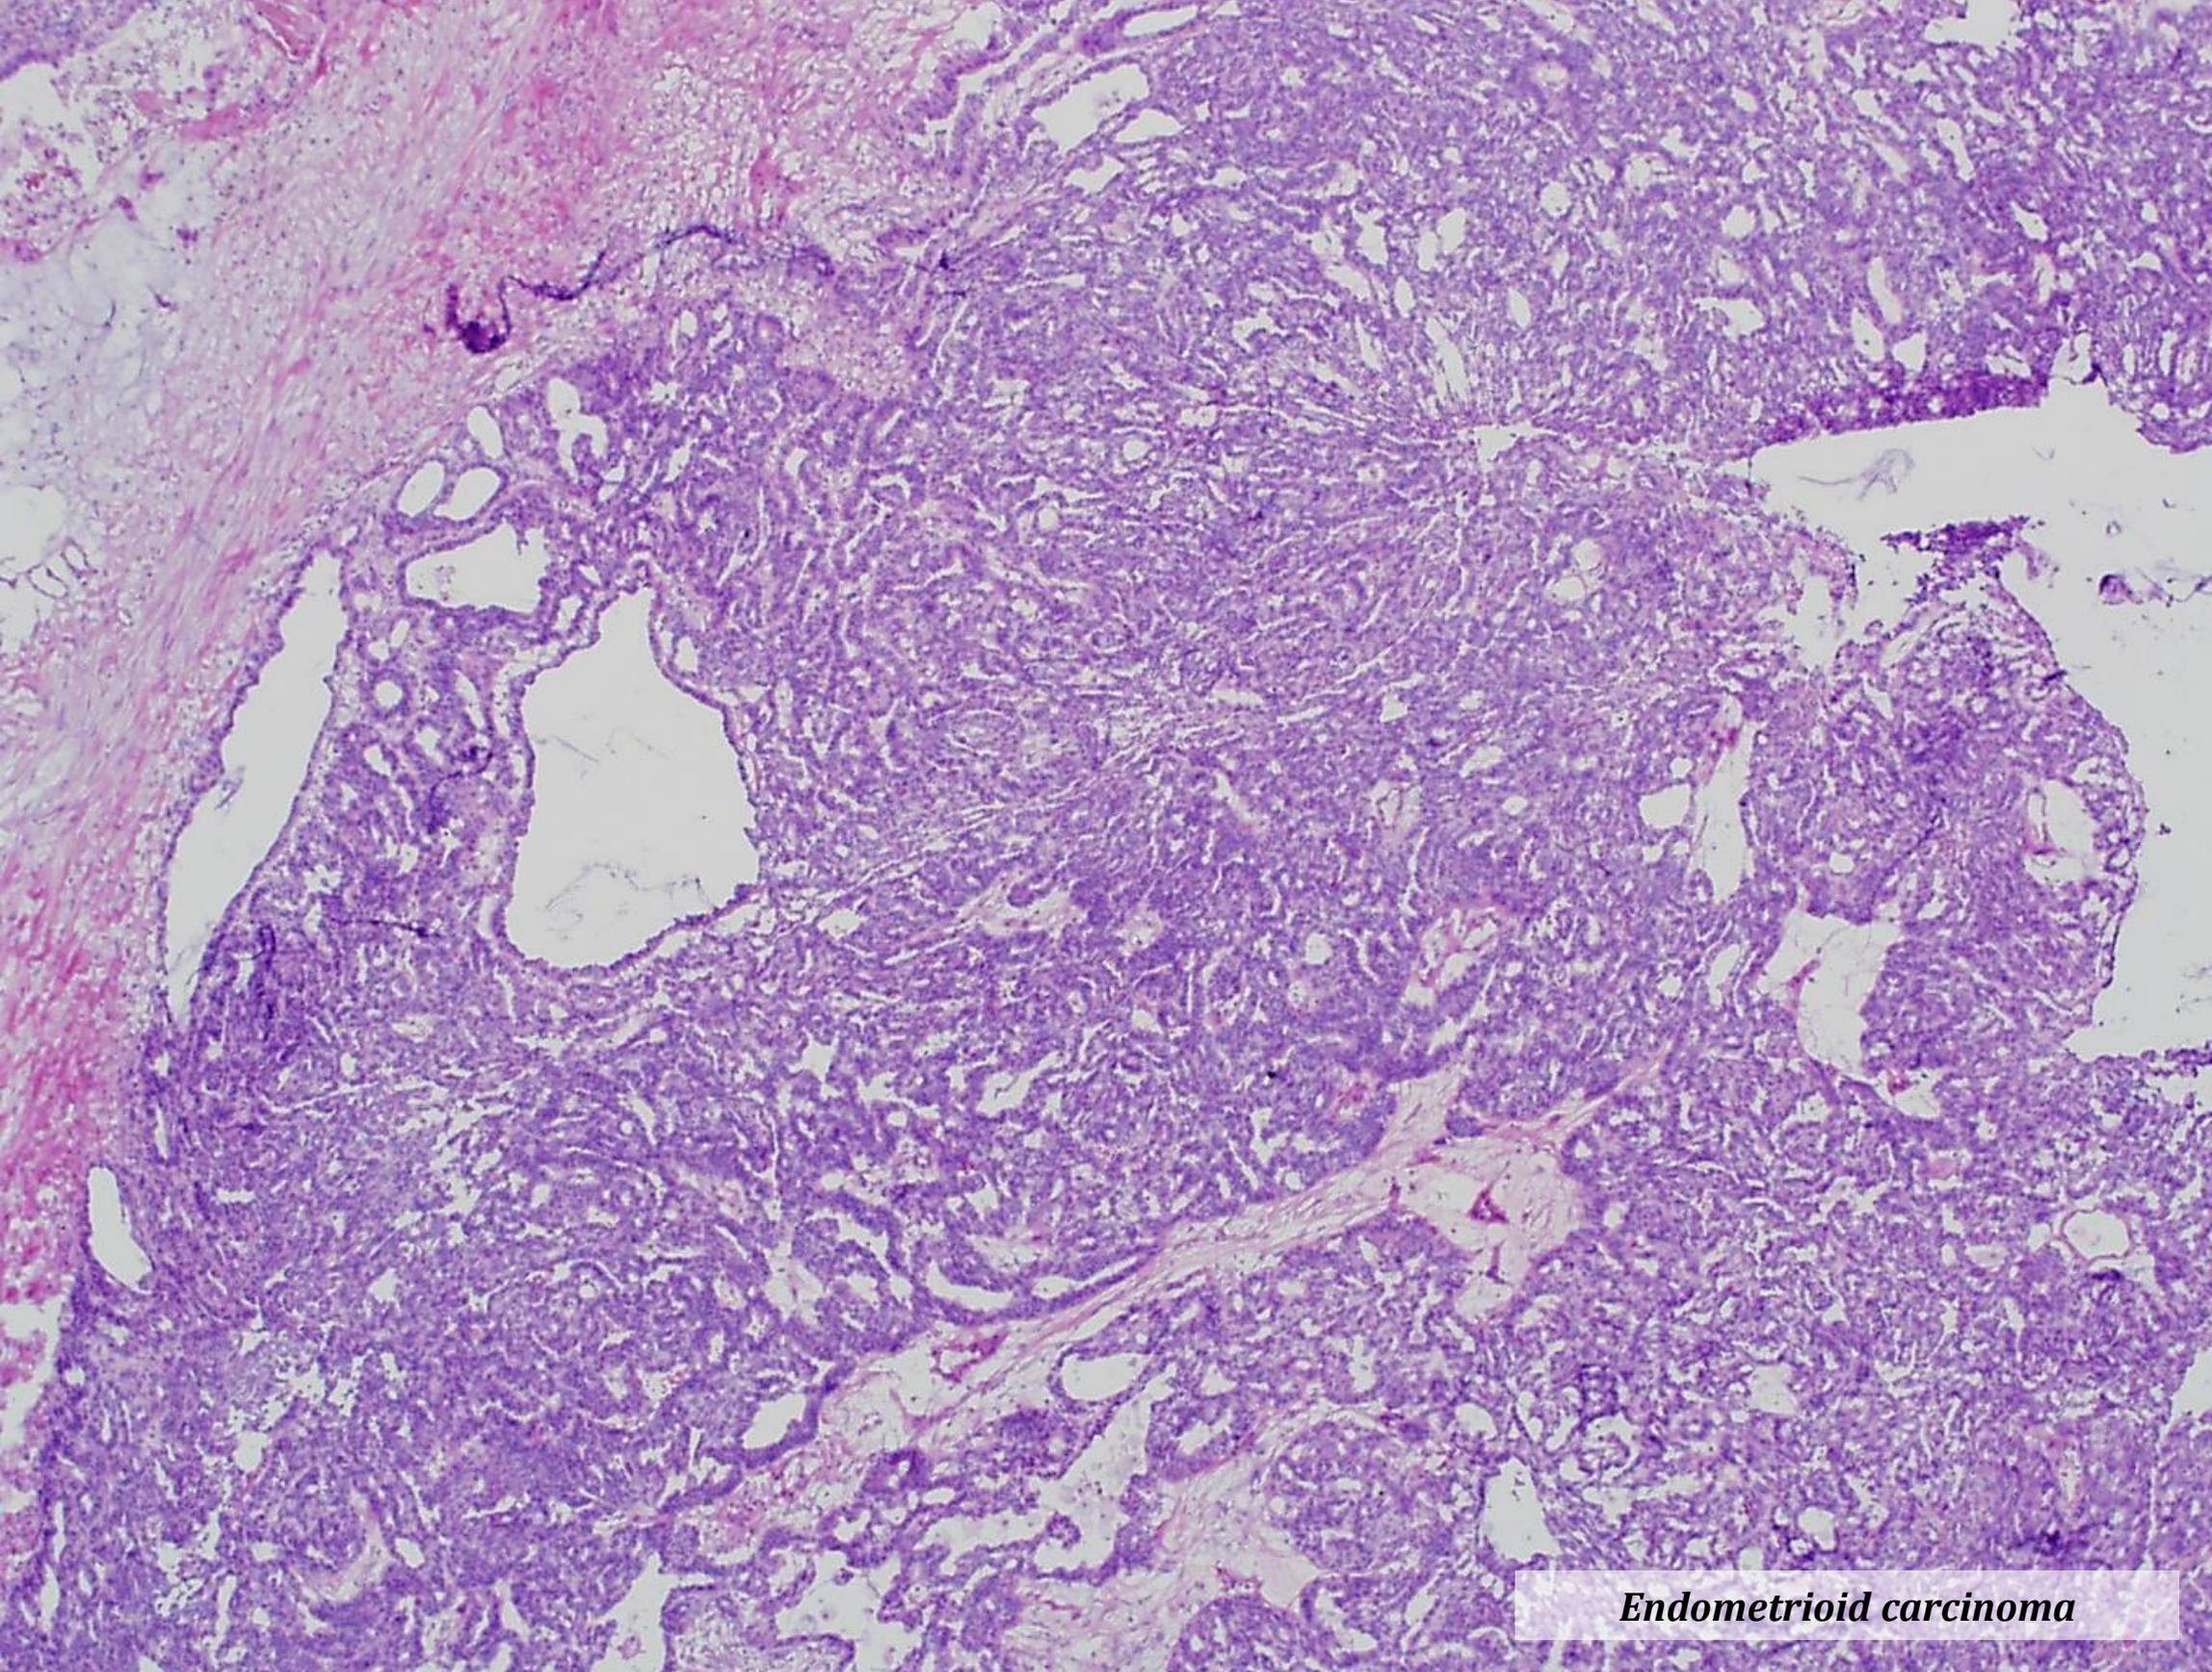

***Endometrioid
Neoplasms***

Endometrioid borderline tumor/atypical proliferative endometrioid tumor

Endometrioid borderline tumor/atypical proliferative endometrioid tumor

Endometrioid carcinoma

Reasonable Approaches to the Diagnostic Line

*Don't overcommit, but give the surgeon enough
information to proceed*

CYST WITHOUT AN EPITHELIAL LINING

- “Denuded simple cyst; no evidence of malignancy on limited sectioning. Defer to permanent section.”
- “Denuded hemorrhagic cyst; no evidence of malignancy on limited sectioning. Defer to permanent section.”

Not uncommon

- *First step: Take a few additional sections for frozen section analysis*
 - *Often encounter this situation with endometriotic cysts (you may find some additional clues in the stroma that would suggest this diagnosis)*
 - *May also occur with serous and mucinous cysts*
- *If, after additional sampling, you still can't classify the lesion ... be descriptive and discuss that there are no overt malignant features in these sections.*

BENIGN CYSTS

- Serous neoplasms:
 - “Serous cystadenoma on limited sampling.”
- Mucinous neoplasms:
 - “Mucinous cystic neoplasm, consistent with/favor mucinous cystadenoma on limited sampling”
- Endometrial neoplasms:
 - “Endometriotic cyst/endometrioma, on limited sampling.”
 - “Hemorrhagic cyst with features suggestive of endometriotic cyst, on limited sampling.”

MINIMAL/FOCAL EPITHELIAL PROLIFERATION OR ATYPIA

- “_____ (serous/mucinous) cystadenoma with focal epithelial proliferation/atyphia, defer to permanent.”

Uncommon scenario

- *First step: Take a few additional sections for frozen section analysis*
- *If, after additional sampling, you are still in the same diagnostic category... discuss your findings with the surgeon. You can state that while you favor a benign lesion, you cannot exclude a borderline tumor and that additional sectioning is needed for definitive characterization.*

In one study, approximately 25% went from benign to borderline tumor on final diagnosis

UNEQUIVOCAL FEATURES OF A BORDERLINE TUMOR

- “**At least** ____ (serous/mucinous/endometrioid) borderline tumor, on limited sampling.”

Most surgeons will proceed with staging if a frozen section is called “borderline” or “adenocarcinoma”.

However, depending on the patient’s age, fertility desires, operative findings, etc., some surgeons may chose to do some degree of modified staging.

If you see clear micropapillary architectural features, mentioning this to the surgeon at the time of frozen section can be helpful (especially in younger patients)

MUCINOUS CARCINOMA

- “Adenocarcinoma with mucinous features.”
- “Mucinous adenocarcinoma, favor ovarian primary on limited sampling.”
- “Mucinous adenocarcinoma, favor metastatic adenocarcinoma on limited sampling.”
- “Mucinous adenocarcinoma, defer to permanent section.”

Discuss with the surgeon your impression regarding the histologic features that are present and if you can favor a site of origin. Often asking about the appearance of the peritoneum, bowel, appendix, etc. can be helpful to assess the probability of a primary or metastatic lesion.

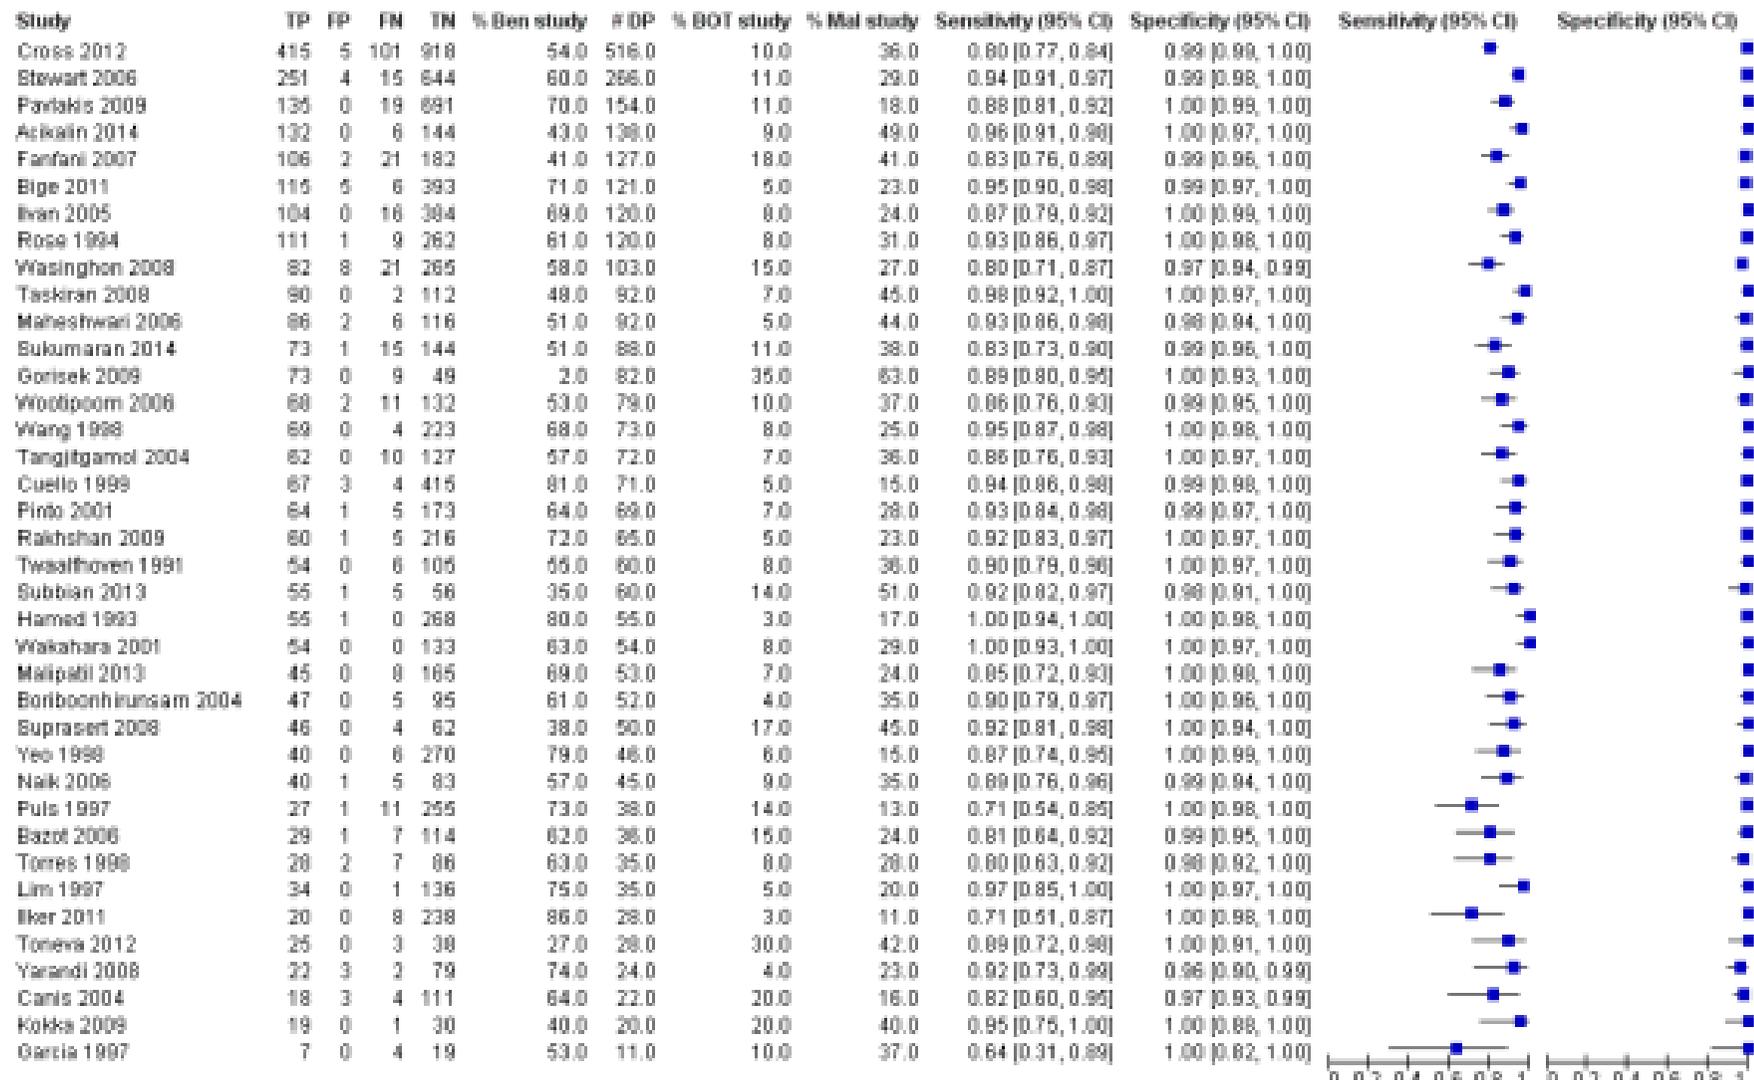

MULLERIAN CARCINOMA (SEROUS, CLEAR CELL, ENDOMETRIOID)

- “High-grade carcinoma/adenocarcinoma, compatible with ovarian primary on limited sampling.”
- “High-grade carcinoma/adenocarcinoma, compatible with ovarian primary with _____ (serous, clear cell, endometrioid) features) on limited sampling.”

For operative purposes, the type of carcinoma (serous, clear cell, endometrioid) doesn't make a difference

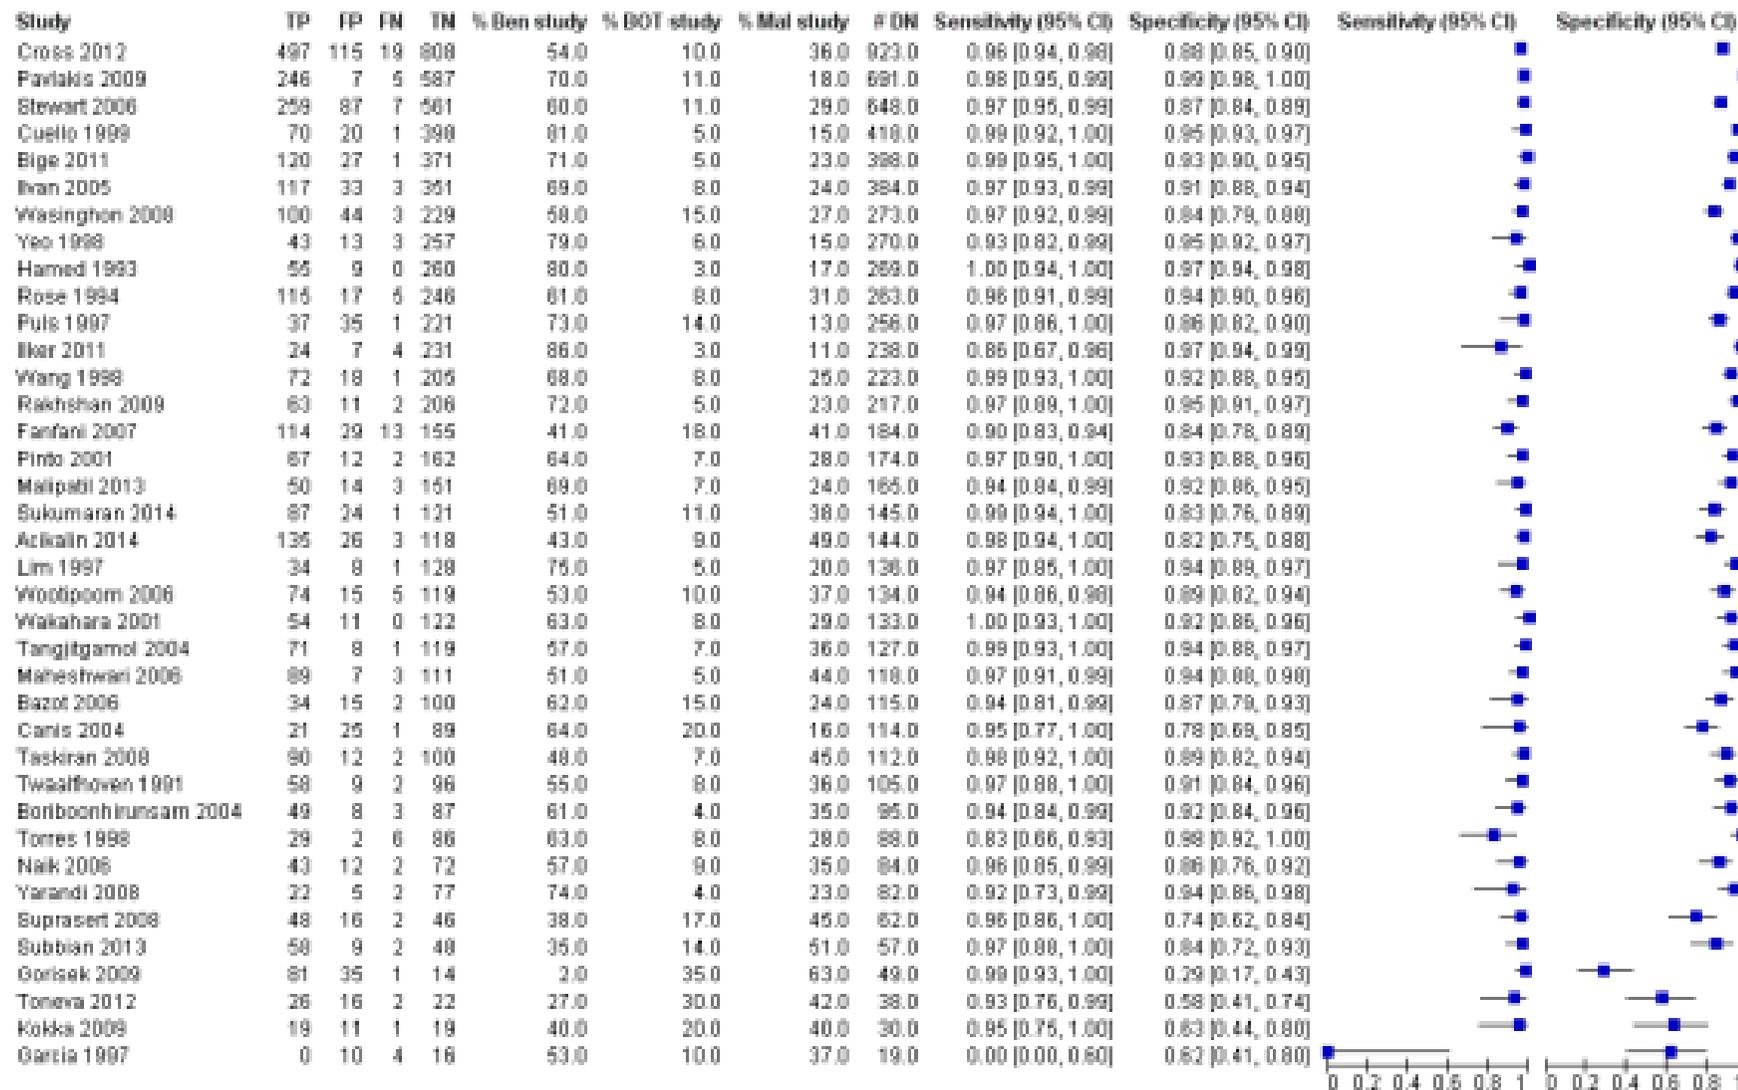

If you see endometrioid carcinoma, you may or may not be able to determine whether the lesion is primary vs. metastatic (look for precursor lesions in the background)

SENSITIVITY AND SPECIFICITY

Forest plot: frozen section threshold **malignant** vs **borderline or benign**

SENSITIVITY AND SPECIFICITY

Forest plot: frozen section threshold malignant or borderline vs benign

FACTORS AFFECTING FS ACCURACY

- Histologic subtype
- Tumor size
 - Various cut-offs proposed: 10, 13, 15, 20 cm
- Expertise of the pathologist?
- Technical limitations
 - Frozen section artifact

Table 1

The relationship between clinicopathological parameters and the concordance of frozen section diagnoses.

Characteristic	Concordance (%)	p Value
Patient age ¹		0.17
<42 years	82	
>42 years	82	
Tumor histology		<0.001

Pearls...

KNOW THE DECISION POINT

What does the surgeon need to know?

ULTIMATE GOAL:

Facilitate the appropriate selection of women requiring surgical staging

- *Principally – which patients need a lymph node dissection?*

Incidence of lymph node metastases correlates with the depth of invasion and grade of tumor

DO YOU NEED A FROZEN?

Preoperative biopsy grade:

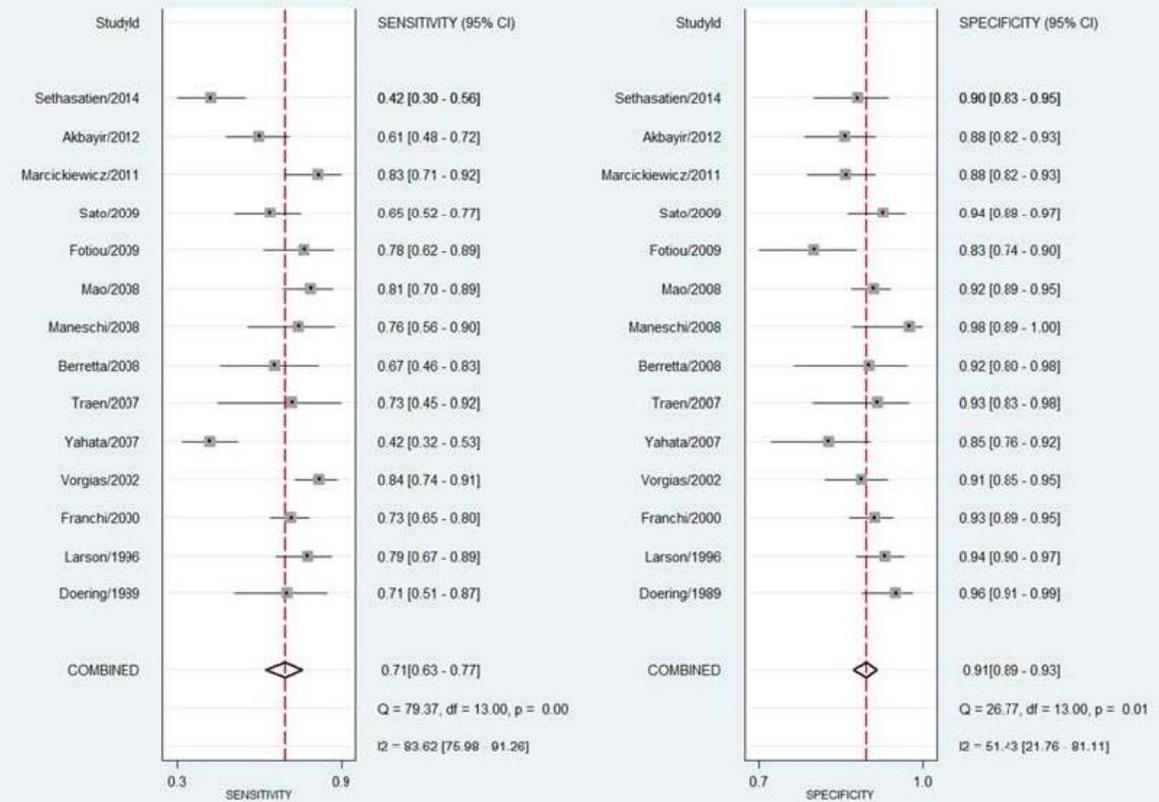

- Variable correlation between preoperative biopsy/curettage and final pathology

Depth of invasion:

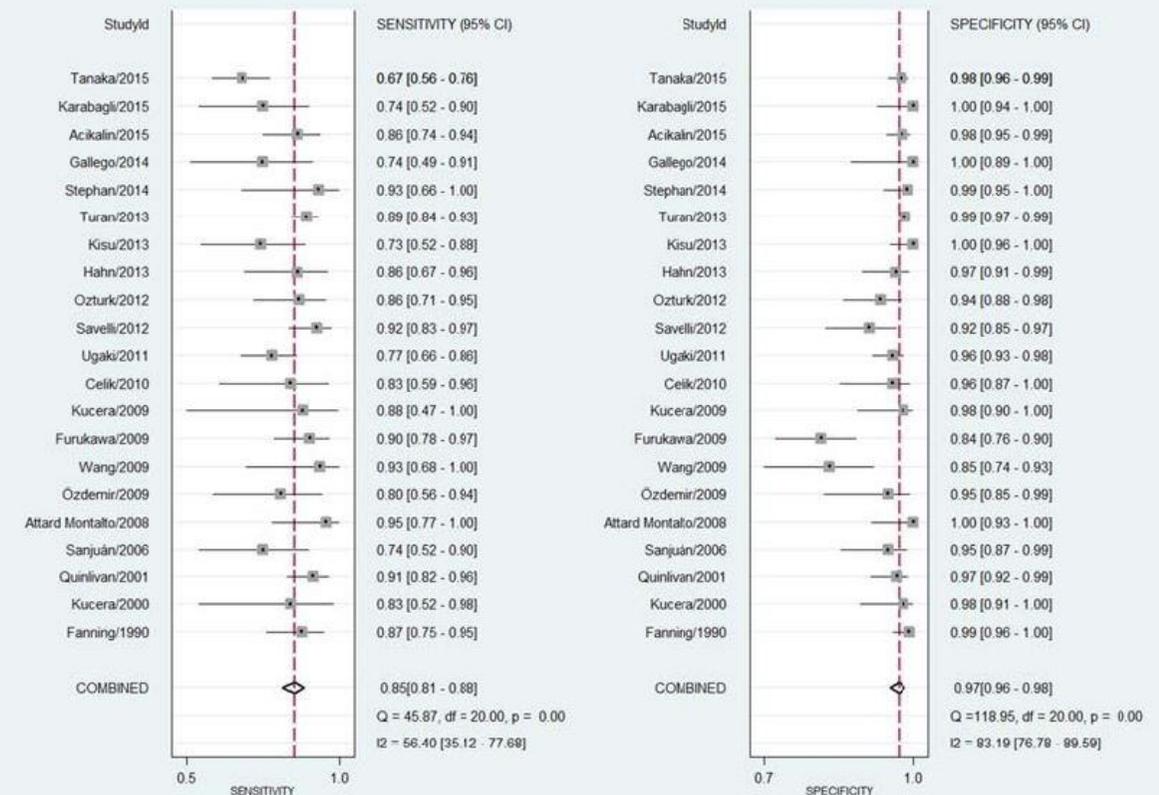

Is a gross assessment adequate?

- In some cases -- Yes
- HOWEVER...
 - Gross assessment of depth of invasion becomes less accurate as the grade of the tumor increases
 - Some patterns of invasion may be difficult to grossly identify
 - i.e. MELF pattern (Microcystic Elongated and Fragmented)
 - Benign mimics of invasion
 - i.e. Adenomyosis (may or may not be involved by tumor)

Intraoperative Gross Examination

Intraoperative Frozen Section

Alcazar JL, Dominguez-Piriz J, Juez L, Caparros M, Jurado M. Intraoperative Gross Examination and Intraoperative Frozen Section in Patients with Endometrial Cancer for Detecting Deep Myometrial Invasion: A Systematic Review and Meta-analysis. *Int J Gynecol Cancer* 2016;26:407-415.

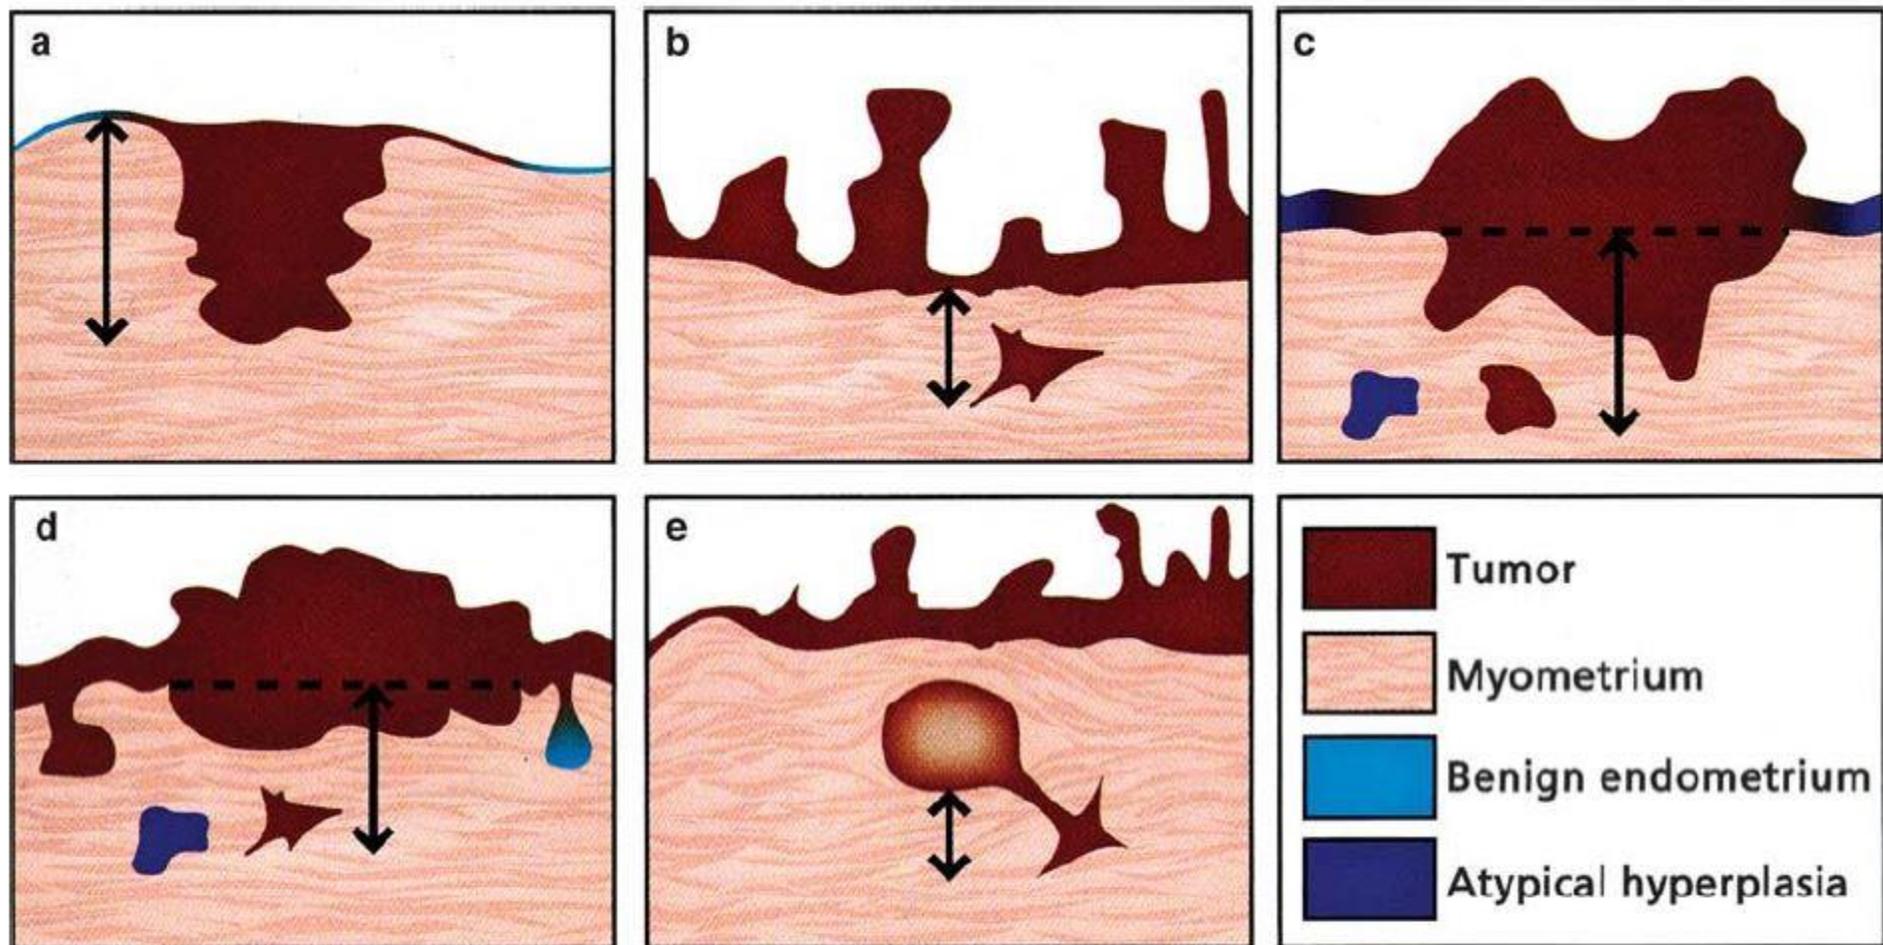

Figure 2 Assessment of myometrial invasion. (a) Direct invasion from the endometrium is the most recognizable and reproducible form of invasion, particularly when the advancing front is jagged and associated with a stromal response. In this situation, the depth of invasion is measured from the nearest adjacent uninvolved endomyometrial junction to the deepest focus of invasion. (b) Discontinuous myometrial invasion; ensure the discontinuous focus is invasive (illustrated by spiculated contours), not adenomyosis colonized by carcinoma (illustrated by rounded contours in c–e). (c and d) Depth of invasion in these cases is measured from a virtual plane whose location is estimated from the adjacent endomyometrial junction. In c, the invasive focus is represented by a broad, pushing front, a pattern that is difficult to evaluate. Pushing invasion can often be recognized by the presence of a stromal response at the leading edge. In d, the invasive focus is mostly discontinuous; the discontinuous focus of myometrial invasion can be distinguished from adenomyosis because of its spiculated shape. Histologically, the lack of endometrial stroma and the presence of surrounding desmoplasia are the two most helpful features that indicate myometrial invasion is present. (e) Rarely, carcinoma may arise in adenomyosis or invade from a deep focus of adenomyosis. In this situation, the depth of invasion should be measured from the junction of the adenomyosis and myometrium to the deepest area of invasive carcinoma. (This figure was published in *Uterine Pathology*, Copyright Cambridge University Press, 2012).

Table 1
Guidelines for surgical management of endometrial cancer at Mayo Clinic,
Rochester, Minnesota (2004–2006)

Hysterectomy
Bilateral salpingo-oophorectomy
Peritoneal cytology
Bilateral pelvic and para-aortic lymphadenectomy
Para-aortic dissection up to renal vessels
Excision of gonadal vessels at insertions (optional)
Omit lymphadenectomy if no disease beyond corpus and
(1) Endometrioid (grade 1 or 2), MI \leq 50%, and PTD \leq 2 cm; or
(2) Endometrioid and no MI (independent of grade and PTD)
Omentectomy, staging biopsies, or cytoreduction for nonendometrioid or
advanced disease

Abbreviations: MI, myometrial invasion; PTD, primary tumor diameter.
Data from Mariani et al. [28].

Pitfall #3...

SCENARIO

Premenopausal woman with an history of abnormal pap smears presents with an “endometrial mass” and vaginal bleeding that required numerous blood transfusions. The clinical team was unable to get a preoperative biopsy due to the bleeding and proceeded with hysterectomy.

Grossly, mass centered at lower uterine segment/upper endocervix with involvement of the endometrial fundus.
